Abstract ;

This study aims to identify the role of school administration in the health education of junior high school students and to learn about the actions that have been taken by college administration, including principals, administrators, teachers, and aims to raise students' awareness of the prevention of diseases and viruses, this study was carried out on the means of preventing Covid 19 in two colleges in Laghouat. After this study, we conclude that the school management has made every effort to limit the spread of the virus within the establishment by strictly applying the health prevention protocol stipulated by the Ministry of Health and by activating the various protection mechanisms and prevention and in addition to health advice and guidance.

1. Introduction

The In light of the recent global health crisis, which affected all countries of the world due to the rapid and terrible spread of the Corona virus Covid 19, which appeared in the city of Yuhuan, China in 2019, and in front of the inability of international health organizations to find a cure for this virus after it led to the death of many people in all countries, it was necessary for government bodies and health organizations to resort to preventing the virus by finding a strategy to limit the continuous spread of it by closing borders between countries and stopping all activities. Social and economic that depend on gatherings, which negatively affected communities economically and socially, but after the discovery of the vaccine against this virus, the return to life activities began at a steady pace, supported by caution and caution, adopting preventive measures to limit the expansion of its spread.

In the midst of the gradual return to normal life and the return of students to school under a health protocol strictly applied in educational institutions, and under the supervision of the school administration, health awareness for students and the imposition of preventive measures on workers in these institutions, this study came to put the school administration under the microscope of scientific research and to identify the mechanisms of prevention of the virus in the averages, and the extent to which the health protocol stipulated by the Ministry of Health is applied in educational institutions, and to

identify the extent to which students respond to this health protocol.

The hypotheses of the study were about the extent to which the school administration contributes to instilling the concepts of health culture among students, and the establishment of concepts and behaviors that enhance health awareness and contribute to the prevention of the Corona virus Covid 19, and what are the effective preventive mechanisms that limit the spread of diseases and viruses in the educational system, and as a research method, we used a case study for two averages in the city of Laghouat, where field research was conducted, we distributed the questionnaire to the workers in the two institutions, including administrators, professors and workers.

The study found that the school administration contributes in one way or another to limiting the spread of the Corona virus Covid-19 by multiple awareness means such as holding seminars, distributing leaflets, applying the health protocol for prevention, and to maintain the public health of students, whether inside or outside the institution, protect them from infection, and raise awareness of the seriousness of the virus in order to contribute to its siege and elimination.

2. -Theoretical framework of the study:

2.1- Problematic:

The development witnessed by the world in all fields and the interdependence between social systems for social advancement and the formation of a developed and conscious society, and the lack of attention to the health aspect of the individual, so public health programs were trying to reach the citizen to raise his health awareness and

reduce the spread of diseases in society, and on the other hand, the educational system and its money of great importance in social construction and contribute to maintaining its safety, the authorities have given coordination between educational and health institutions and the inclusion of preventive awareness programs among the priorities of the educational system and that By activating the role of health counseling within educational institutions, linking civil society with the educational system in its various institutions, in addition to highlighting the role of the teacher and administrative staff in educational institutions for all stages in educating students about health concepts and improving their health behavior to be role models and contribute to the transfer of concepts of health culture to society.

With the emergence of the global health crisis and the rapid and terrible spread of the Corona pandemic and its danger, one of the strategies to combat this virus, the new strain Covid 19, was the process of health awareness in educational institutions in order to draw attention to the seriousness of the disease and ways to prevent and limit its spread to protect the individual and society, from this point of view, this study came as an attempt to lift the curtain on the role of the school administration and focus on the prevention mechanisms and measures stipulated by the Ministry of Health and the extent of their application in these institutions, so the research problem was identified in The role of the administrative staff and professors in the averages in the city of Laghouat as a model to contribute to limiting the spread of the Corona virus Covid-19,

From it, we ask the following question: What is the role of the school administration in health awareness to limit the spread of the Corona virus Covid 19 in educational institutions?

2.2- Hypotheses:

- The school administration, including teachers and administrative staff, contributes to health awareness about the prevention of the Corona virus Covid-19 among intermediate students in the city of Laghouat.

- The school administration resorts to adopting different mechanisms in health awareness about the prevention of the Corona virus Covid-19 among students of some averages in the city of Laghouat.

2.3- Objectives of the study:

- Shedding light on the importance of health awareness among students in the three educational stages.

- Detecting the extent to which school administrative staff and students interact with health awareness in light of the spread of diseases and viruses.

- Research on the extent of the use of preventive means of viruses and training in their use.

- Instilling the idea of prevention is better than cure, especially with the Covid-19 virus, and alerting to the difficulty of treating it, so focus on its prevention and its importance and benefit.

3.1 Previous studies:

First study:

Study Ziad Ali Al-Gergawi and Mohammed Hashem Agha (2011) entitled The reality of the application of health education in public education schools in Gaza City, this study aimed to identify the reality of health education in public education schools in Gaza City, and they used in their study the descriptive analytical approach in the study, they relied on the questionnaire as a research tool and was distributed to 129 supervisors of health education supervisors at the level of 50 schools in a random manner, and the researchers reached the following results:

- Schools carefully monitor the school health environment, recording a relative weight of 91.469.

- The school has a role in providing health care services to pupils and teachers and recorded a relative weight (87.51).
- The school has a role in health education for pupils and scored a relative weight (83.45).
- The school cares about the mental health of students and scored a relative weight (85.04).

-Second study:

The study of Abdul Ghani Brahmia, Zain Al-AbidineBakhoush, mechanisms for protecting health in the school environment in normal circumstances and in light of the Corona pandemic (Covid 19) as an exceptional circumstance, 2022, this study aimed to highlight the legal measures produced by the Ministry of National Education to raise the health level of students in schools in normal circumstances, and they used in their study the descriptive analytical approach and the historical method in the study, and the researchers concluded that the most important results were despite the efforts made by the Ministry of Education to embody the right to protection Health in the school environment, through the enactment of many regulatory texts, but these texts have not been applied as required in reality, and many procedures need to be reviewed to keep pace with developments.

3.2 Study concepts:

-Management:

Idiomatically: The concept of management differs from one thinker to another due to the different views of thinkers, as we find Tariq Taha defines it as "the process of performing work with or

through others to accomplish organizational goals in a changing environment")Taha(2008 ‘

It was also defined as "the set of processes by which human and material potential is sufficiently developed and directed to achieve goals, as actions are carried out by others through planning, organization and control")Al-Naji(2012 ‘

-School Administration:

Idiomatically: School administration is defined as "an integrated system aimed at planning and managing the human and material resources available to the school and reaching decisions whose application leads to achieving the desired goals effectively, and there are those who define school administration as an organized activity within the school that works to achieve its goals" (Abdeen, Modern School Administration, 2001)

-Health Awareness:

Idiomatically: It is defined as a media process aimed at urging people to follow healthy practices in order to raise the health level of society, reduce the spread of epidemics and diseases, and educate community members by informing people about the danger of diseases, and providing them with instructions to prevent them, through meetings, lectures, seminars, distribution of health bulletins and other media" (Yasmina, 2021)

It is also defined as communication and media educational activities that aim to create health awareness, inform people about the reality of health, warn them of the dangers of contracting diseases that surround them, and seek to spread health and preventive culture” (Amrar, 2021)

Procedurally: It is the process of providing students with a health culture and information to reduce the risk of the spread of viruses and diseases, where the middle school informs and guides students by taking measures and mechanisms that contribute to this.

-COVID-19:

It is a virus from a new strain of rapidly spreading viruses, not discovered in humans before, this virus appeared in 2019 in Wuhan, China, and the World Health Organization called it on 12-01-2020 the name of Covid 19 and the organization defined it as a new strain of coronavirus that was first reported on 31-12-2019. (Al-Sharif, 2021)

where it begins with a common cold to acute respiratory syndrome and leads to death if the patient has chronic diseases related to immunodeficiency and respiratory. This virus causes pneumonia, making it difficult to breathe.

The seriousness of this epidemic is evident in the speed of its spread among people, as it is transmitted when close contact between individuals, through droplets of fluid issued by the infected person through coughing, sneezing, talking or touching surfaces contaminated with the virus, including diseases such as fever, cough, fatigue, shortness of breath, loss of sense of smell and taste, sore throat, diarrhea ... and other symptoms.

-School administration and mechanisms to prevent the transmission of the Covid-19 virus:

School Administration:

School administration is one of the most important basic elements that contribute to the success of the educational process as it defines "it as a set of functional processes that interact positively with the appropriate climate inside and outside the school, developed by the state in order to prepare a generation consistent with the goals of society and the state." Principles of school administration. (Al-Amayreh, 2002). Through this concept, it is clear that they are executive and functional processes represented in planning, coordination and guidance. These processes interact within an appropriate atmosphere, in accordance with an educational public policy

developed by the state in order to Achieve set goals.

It is also defined as: those coordinated efforts carried out by the principal with the staff, including teachers and administrators, to achieve the educational goals within the school in line with the nation's goals of raising children correctly and soundly" (Abdeen, Modern School Administration, 2001)

The school administration takes preventive measures within the institution to reduce the spread of diseases and viruses among students and workers and to maintain public health in the educational system, it attaches importance to achieving health follow-up for students in the school environment, so the student's enjoyment of good health psychologically, physically and mentally is an important factor in the process of learning and knowledge acquisition.

-Advantages of school administration:

It is characterized by humanity and social, and it also has targeted strategic objectives in line with the general policy set by the state, as it follows the principle of partnership and consultation between the director and his educational staff, meaning that it is based on positive and flexible cooperation and mutual respect.

Its most important advantages are also highlighted in "the diversity of its functions and the services it provides to members of society, and its close link with society". (Arabi, 2004)

-The role of school administration in health awareness:

In the event that a student is infected with the disease, the teacher can detect it and inform the administration about the case and the administration sends it to the school doctor or his parents, "The teacher can also educate students, instill healthy habits and urge them to do things of importance to avoid infection, such as hand washing and

personal hygiene, and he can educate them about the importance of food and its role in preventing diseases" (Jarjari & Agha, 2011)

The school administration aims to educate and guide children and raise them in a proper manner, through which the student learns sound behaviors, habits and values, leaving and changing bad habits in light of the coordinated efforts taken by the school administration, and this health culture that means the process of delivering the necessary information for the practice of children that reflects the health of students, school staff and society.

Procedures and mechanisms to prevent the transmission of COVID-19:

In light of the exceptional circumstances resulting from the application of preventive measures to prevent the spread of the Corona virus, which require providing a healthy and safe school environment for study and follow-up of students, the National Education, in coordination with the Ministry of Health, Population and Hospital Reform, has carried out preventive health measures". (Brahmiyya & Bakhoush, 2022)

the school administration made coordinated efforts between the principal and the educational team of teachers, workers and administrators in order to educate students and followed strategies to prevent the risk of infection with the Corona virus Covid-19 by providing them with a healthy culture and providing them with instructions. To follow a health protocol and provide tips represented in:

- Ensure hand hygiene and sterilize them with finger rubbing.
- Social distancing, that is, leaving a distance between the individual and others in order to avoid the transmission of viruses through

sneezing and coughing, as the policy of cohorts was followed.

- The necessity of wearing a mask.
- Eat healthy foods to strengthen the immune system.
- Avoid shaking hands and touching non-sterile surfaces such as tables, chairs and door handles, with the need to ventilate sections and open windows to ensure adequate ventilation and to renew the internal air.
- Avoid sharing tools and utensils with others.

-Mechanisms to confront the Covid virus and limit its spread within the school:

The school used preventive awareness mechanisms by acquiring a quantity of sterilizer and masks and distributing them to students, placing sterilizer bottles at the school gate, measuring the temperature of everyone who enters the institution, using adhesive tape to determine the distance, sterilizing the entire school once or twice a week, allocating a place to stand Relying on the law of voyage Setting regulations, distributing leaflets and clippings, and preparing awareness campaigns to educate students about this virus and urging them to educate their families, and obligated students to report any suspicious case , and in case of feeling any symptoms of high body temperature, cough, sore throat,And other symptoms they have to stay at home, and this is called quarantine, which is the retirement of people for a period of time while taking the vaccine and the necessary medicines.

The Ministry of Education also called for organizing the space of educational institutions by developing a plan for how students move and applying preventive and

precautionary measures when receiving employees and candidate students, including (physical distancing when entering and leaving, in the halls designated for review or when moving between facilities, as well as hygiene rules and wearing a protective mask...) in addition to preparing the halls designated for review and study for students to ensure the implementation of the preventive health protocol. (Alalal, 2020)

Like other countries that have adopted precautionary measures in educational institutions, the Ministry of Education was keen to take many precautionary measures and measures regarding the Corona virus, in cooperation and coordination with the Ministry of Health, as part of measures aimed at enhancing prevention and limiting the spread of any virus, as the Ministry indicated in a statement to launch extensive awareness campaigns directed to students and teachers after the end of the holiday and return to schools to prevent and address this virus. She stressed on all school administrations at all educational levels the need to activate the role of school clinics and take all health measures followed in the event of any disease related to high temperature for anyone. It was also emphasized to take preventive measures that would preserve the safety and health of teachers, learners and all employees in schools, sectors and departments of the Ministry. The ministry also called on all citizens and parents not to pay attention to any rumors or rumors that would provoke fear and panic among people, and to rely on official channels and sources approved in the investigation of information. (Ezzahi, 2020)

The government has issued statements to address the health crisis and limit the spread of the Covid-19 coronavirus (COVID-19) (... Taking preventive measures to be implemented under the title of the management body of the health crisis related to the Covid-19 pandemic, as they

always fall within the framework of preserving the health of citizens and protecting them from any risk of the spread of the Corona virus Covid-19, and in view of the epidemiological situation, these measures aim to extend the work of the current protection and prevention apparatus for a period of ten (10) days..... The Government strongly and urgently renews its calls on citizens to continue supporting national efforts to combat this global epidemic by continuing to respect prevention measures, especially with regard to the mandatory wearing of a protective mask, hygiene and physical distancing measures, and in particular its calls for citizens to resort to vaccination, which remains the best means of prevention in order to protect our citizens from the seriousness of the effects of this epidemic..... In this same context, The government has decided to ensure, with all the required stringency, the application of the procedures for closing institutions, spaces and places where any violation of the health measures taken in this area may be observed, in particular the mandatory wearing of a protective mask, hygiene and physical distancing measures, as well as health protocols for various activities....). (Statement, 2022)

3.3 Field framework of the study:

3.3.1- Curriculum Procedures:

In this study, the researchers adopted the case study approach as an appropriate approach to the study, where a case study was conducted for two averages in the city of Laghouat.

3.3.2 Research community: The research community is represented by workers in the school administration, including managers, administrators, professors and professional workers in the educational institutions of the intermediate stage in the city of Laghouat.

3.3.3- Data collection technology: The questionnaire was used to collect data, as

the researchers distributed 60 forms and 55 forms were retrieved.

3.4- Fields of study:

-Spatial field: The study was in the city of Laghouat, where the questionnaire was distributed to the two averages (the martyr Baaj Mohammed and Sharek Abdel Qader).

-Human field: represented in the middle managers, administrators, professors and professional workers of the two institutions.

-Time Domain: The study was between March and June 2022.

3.5-Presentation of data and analysis of results:

-Display of data

Table 1. Shows the general data of the respondents (sex, job grade)

Sex Job Rank	Male		Female		Total	
	C	%	C	%	C	%
Manager	2	100	00	00	99.1	99.1
Consultant	0	00	5	100	05	99.1
Professor	6	20	24	80	30	54.55
Administrative Assistant	3	20	12	80	15	27.27
Occupational Worker	3	100	00	00	03	5.45
Total	4	25.5	41	74.5	55	100

Through the table, we note that the percentage of females working in the two averages is higher than the percentage of males, as it is 74.5% for females compared to 25.5% for males, and we also note that the two job ranks (manager, professional worker) were for males, unlike the job rank consultant for females, but with regard to the rank of professor, which is the highest percentage of the total variable functional rank by 54.55%, the percentage of females in this rank was higher than the percentage of males by 80% professors compared to 20% professors, and with the same difference ratio for the job rank Administrative Officer.

We conclude that most of the respondents are of the rank of professor and this is one of the characteristics of educational institutions, and we find that the majority of these professors are female, as we justify the social change that has occurred in the educational system and the exit of women to work and enter the education sector in particular as professors or work in the administration.

In addition to the above, we find that the teacher has an important role in health awareness within the institution for his direct and greater communication with students,

It contributes to the application of the health protocol within the department, such

as obliging students to wear a mask and the continuous use of sterilizer, ventilating the department by opening windows, spacing between students, reporting cases of infection among students, and it also has

the role of guidance by providing lessons that clarify the seriousness of the disease to individuals and society and ways to prevent it.

Table 2: Shows the last time the institution was sterilized according to the permission of the respondents

A time Answers	A time when the institution was sterilized	
	C	%
a month ago	15	27,3
two months ago	14	25,4
More than 3 months	22	40
Not answering	04	7,3
Total	55	100

The table shows the sterilization time of the two institutions according to the respondents' answers, where we find that the two averages were sterilized more than 3 months, by 40% of the total answers.

We conclude from it that the administration in the two averages is keen to sterilize the

institution from time to time, but since this study was at a time when the number of infections with the virus declined and its spread was controlled, the time difference between sterilization and another was in divergence, unlike what it was at the beginning of the emergence of the disease.

Table 03: Shows the respondents' answers about the use of sterilizer

Answers	Providing sterilizer in the administration or at the door of the institution	
	C	%
Yes	46	83,6
No	03	5,5
Sometimes	06	10,9
Total	55	100

The top table shows that the administration provides sterilizer in the administration or at the door of the institution, according to the statement of the majority of respondents, by 83.6%.

We conclude that the administration in the two averages attaches importance to the sterile use, which is a medical product and an effective way to kill the virus because it contains 60% of alcohol and is constantly accessible to the individual after touching surfaces in transportation and in multiple

places, door handles, water tap, etc., and for ease of carrying it with him and as an alternative to washing hands with soap and water because the virus is transmitted through contact with the eyes, nose or mouth with hands contaminated with the virus, so the administration is keen to provide it continuously and in places Multiple in the organization as the entrance to the institution so that it is accessible to everyone and for continuous use.

Table 04: Respondents' answers about preventive measures in the institution

the thermal detector Answers	Using the thermal detector at the door of the institution		Identification with strips in order to distance students	
	C	%	C	%
Yes	29	52,7	47	85,5
No	08	14,6	08	14,5
Sometimes	18	32,7	/////	/////
Total	55	100	55	100

We note through this table that the respondents stated the use of the administration of the thermal detector at the door of the two institutions by 52.7% compared to 32.7% of the respondents answered sometimes about the use of the thermal detector, and with regard to the identification of strips in order to space students, the highest percentage was 85.5% answered yes to the use of strips.

We conclude from this statistical reading that the administration resorted to using a thermal detector at the entrance to the institution to detect any rise in temperature among middle school workers or students, which is considered as an indicator of fever, and the latter is a symptom of **COVID-19 in the institution**

infection with the virus so that the administration can take the necessary measures against the infected person, such as isolation, distancing, medical examination and contact with the Civil Protection or the Department of Combating Covid 19, and adhesive tapes of different colors were used in places of standing or sitting as a mandatory preventive measure to impose a distance Safety – 1.5 m – between pupils in yards or in classrooms so that there is no contact between them and the spread of infection through coughing or sneezing droplets.

Table 05 : The availability of drawings, posters or awareness banners on the risk of

Answers	Availability of awareness drawings, posters or signs to prevent the virus	
	C	%
Yes	49	89,1
No	06	10,9
Total	55	100

Through the table, we find 89.1% of the respondents stated the availability of awareness and guidance drawings and posters to prevent the Covid-19 virus, compared to 10.9% who stated that they are not available.

We conclude that the management of the two averages strives to provide preventive indicative posters on the walls of the institution to provide information to

everyone in it, regarding how to exploit preventive means such as washing hands with soap and water for 20 seconds and the correct method, and caution against contact with contaminated surfaces, door handles and water taps, with an emphasis on the continuous use of sterilization gel, in addition to the mandatory wearing and adapting of the mask, in addition to drawings expressing information about the

virus, the ways of infection and its risks, and the importance of prevention and vaccination against it. This is consistent with what was stated in the previous study mentioned above on the mechanisms of protecting health in the school environment in normal circumstances and in light of the

Corona pandemic (Covid-19) as an exceptional circumstance about the measures taken by the Ministry of Education and the preventive measures it has taken to limit the spread of the virus in the school environment.

Table 06: Shows the relationship between the obligation to wear a mask and receiving the COVID-19 vaccine

Wearing a mask Receiving the vaccine	Yes		No		sometimes		Total	
	C	%	C	%	C	%	C	%
yes	12	32,43	00	00	03	18,75	15	27,27
No	25	67,57	02	100	13	21,25	40	72,73
total	37	100	02	100	16	100	55	100

Through the table that shows the relationship between wearing a mask and receiving the vaccine against the virus, we find that the majority of 72.73% answered "no" to receiving the vaccine against the virus, where they answered 67.57% yes to wearing a mask and 21.25% answered "sometimes" to wear a mask, while the next percentage, estimated at 27.27%, answered "yes" to receiving the vaccine against the virus, we find 32.43% confirmed their answers with "yes" for wearing a mask and 18.75% answered "sometimes" for wearing a mask, We also find the ratio 00 "no" to wearing a mask.

We conclude from the above that the majority of the respondents did not receive the vaccine against the virus, justifying this

for multiple reasons, most notably the fear of the side effects of the vaccine and the misinformation promoted about it and questioning its effectiveness, so it was considered that wearing a mask is sufficient to protect it from infection with the virus, and there are those who justified not receiving the vaccine by being infected with the disease in that period, and as it is known, vaccination is prohibited for those who are infected with the virus for about two months, and on the other hand, the rest of the respondents stated that they received the vaccine against the virus and with They acknowledged wearing a mask as a mandatory preventive measure that should not be abandoned.

Table 07: Shows the relationship between holding awareness seminars against the risk of the spread of the Covid-19 virus and the registration of cases of infection with the virus:

Holding awareness seminars Recording of virus cases	Yes		No		Total	
	C	%	C	%	C	%
Yes	24	80	07	28	31	56,36
No	06	20	18	72	24	43,64
Total	30	100	25	100	55	100

Through the previous table, which shows the relationship between holding awareness seminars warning of the danger of the spread of the Covid-19 virus and recording cases of infection with the virus, we find that the highest percentage, which is 56.36%, acknowledged the registration of cases of infection with the virus, of whom 80% admitted "yes", cases of infection were recorded after holding awareness seminars, and 28% answered "no" to holding awareness seminars.

As for the next percentage, estimated at 43.64%, they answered "no" to registering cases, where the highest percentage of

Table 08: Shows the relationship between providing awareness and guidance leaflets on the danger of spreading the Covid-19 virus to students and the extent to which students are committed to bringing sterilizers with them:

Providing awareness leaflets to students Bring students sterilized	Yes		No		Total	
	C	%	C	%	C	%
Yes	23	50	01	11,11	24	43,64
No	08	17,39	03	33,33	11	20
Sometimes	15	32,61	05	55,56	20	36,36
Total	46	100	09	100	55	100

Awareness and guidance leaflets for students about the danger of the spread of the Covid-19 virus and the extent to which students bring sterilizer, we find that 43.64% answered "yes" to bring students sterilized, where 50% answered "yes" from providing awareness leaflets to students. 11.11% answered "no" to providing awareness leaflets to students.

As for the next percentage, estimated at 36.36%, they answered "sometimes" to bring students sterilized, and we find 55.56% of them answered "no" to provide awareness leaflets for students and 32.61% answered "yes" to provide awareness leaflets to students.

As for the last percentage, which is estimated at 20%, their answers were "no" to bringing sterile students, where we find

them, amounting to 72%, admitted not to holding awareness seminars, while we find 20% of them admitted to holding awareness seminars.

We conclude that the school administration is intensifying its efforts to highlight the risk of the spread of the virus despite the high registration of infections, so health educators had to find multiple mechanisms to try to deliver health culture in the educational institution and warn of infection by holding awareness seminars on the danger of the Covid-19 virus as a complementary measure to the health protocol.

33.33% answered "no" to provide awareness and guidance leaflets and 17.39% answered "yes" to provide awareness and guidance leaflets.

We conclude from the previous statistical reading that the school administration applies any procedure through which it hopes to convey the concept of health culture to students, including providing awareness leaflets to them, which resulted in the commitment of a larger number of students to bring sterilizer, the more means and preventive measures the faster the response to this awareness initiative is of great benefit to the institution's employees and students.

3.5- Analysis of data results:

The results of the first hypothesis:

Through the data and data obtained from the field research of the study and the questionnaire technique directed to the sample members represented by the administrative staff and teachers of the two intermediate (the martyr Baaj Muhammad and Sharek Abdel Qader) in the city of Laghouat, and in accordance with what was stated in the previous study of Ziad Ali Al-Jurjani and Muhammad Hashim Agha and the importance of the role of school administration in activating victim education in schools and health education, either psychologically or in times of health crises,

We have concluded that health awareness about the risk of the spread of the Corona virus Covid 19 is among the priorities of the administration's tasks, which is to strictly apply the health protocol stipulated by the Ministry of Health within the institution, either among workers or in departments among students, and as stated in the previous study of Brahmieh, and the efforts made by the Ministry of Education to embody the right to health protection in the school environment (Brahmiyya & Bakhoush, 2022), through the questionnaire we found that the administration has taken The necessary procedures on how to deal with cases that are suspected of being infected with the virus, as they resort in the first stage to isolate the infected person, even if it is a case of cold or flu, until the Civil Protection or the Department of Combating Covid 19 is contacted to prove infection with the virus or not, through medical examination and conducting the necessary analyzes, and then taking the next step, which is sick leave, quarantine and treatment, If the infection appears among the students, the student's guardian is called, and compared to the first previous study, we find the similarity that health awareness in the

educational institution is activated with a difference in the field of health awareness with the aforementioned measures.

The results of the second hypothesis:

Among the mechanisms adopted by the administration and teachers to prevent the Corona virus Covid 19 and in application of the preventive and precautionary measures called for by the Ministry of Education when receiving students (physical distancing and hygiene rules...) (Alalal, 2020)

the administration has resorted to preventive means, including complete sterilization of the institution from time to time, with the provision of means and materials for cleaning and disinfection, and the thermal detector and sterilizer were used at the entrance to the institution, which is considered an important means in, as well as the development of posters and awareness drawings, especially those that guide to the mandatory wearing of a mask and the permanent use of sterilizer, and continuous hygiene, as adhesive tapes were placed to distance students, and leave a safe distance, whether in the yard of the institution or in the department, The voyage system, where we find an average number of students about 25 students in the department,

As for the preventive measures, they are the separation of individual students, leaving a safe distance between tables and ventilating the section, and obliging students to adhere to the preventive measures stipulated by the Directorate of Education, such as bringing sterilizer and wearing a mask, in addition to imposing on the student not to attend the institution if he feels symptoms of a cold or flu.

On the other hand, the management of the institution has conducted awareness seminars and provided publications to students about the seriousness of infection, prevention of the virus, how to deal with family members so as not to transmit the

virus to them and the correct hygiene methods, and therefore the second hypothesis has been achieved.

-Overall results:

Through what we found in this study on the role of school administration in health awareness to prevent the Corona virus Covid 19 and in application of what was stated in the government's statements to combat this global epidemic by continuing to respect prevention measures, especially with regard to the mandatory wearing of a protective mask, hygiene measures and physical distancing, in order to protect our citizens from the seriousness of the effects of this pandemic. (Statement, 2022)

The school administration, represented by administrators, workers and teachers, has harnessed multiple mechanisms, including the provision of means of sterilization, disinfection and indicative posters, and provides students with advice and instructions to protect themselves from infection and how to deal with their colleagues in the department and outside it and with family members, especially the elderly and the sick, and the most important of these tips are the following:

- 1- Applying the health protocol and adhering to the preventive measures announced by the Ministry of Health and educating them about the seriousness of the disease on the individual and close people, especially the elderly and patients.
- 2- Avoid sitting near suspected cases and contribute to educating family members about the seriousness of the disease.
- 3- For a commitment to put the mask and not to remove it, and to carry the sterilizer and use it continuously for the hands.
- 4- Ventilation of the section, spacing and the way to sit in the tables individually and differently with a distance of 1.5 m
- 5- Spacing between colleagues, leaving a safe distance, not shaking hands, and avoiding gatherings.

6- Not to attend any student who feels the symptoms of a cold and be careful to go to the doctor.

7- Ensuring cleanliness, not using the belongings of others and the tools of colleagues, and not drinking from the same water bottle.

8- Reporting cases of the virus with parents or in the institution.

9- It is mandatory to wear a mask for the teacher and students, with sterilizers on the tables and the teacher's office.

10. Sterilize themselves before entering the house.

11- Throw away the used mask and wear new ones.

12- Hygiene Continuous washing of clothes, hands and all your used supplies.

13- Wash hands with soap well before eating and rinsing frequently.

14- Change clothes and expose them to the sun.

15- Use a tissue when sneezing.

16- Do not approach parents, avoid contact with family members, and do not approach other people if you feel that they are sick.

17- Healthy eating that contributes to strengthening immunity.

18- Quarantine of infected people.

19- Stay away from gatherings, especially for the elderly and sick, such as weddings and funerals.

20- Not going out to the street except for necessity, staying at home, and avoiding gatherings in closed places and public places.

21- Stay away from every doubtful person.

22- Not to visit the elderly and the sick and deal with them very carefully so as not to transmit the virus to them and provide them with advice and guidance.

-On the other hand, the respondents had an evaluative view of the wrong behaviors carried out by students, which contribute significantly to the transmission of infection with the virus between individuals, the most important of which are the following:

- 1- Failure to respect the health protocol and preventive measures.
- 2- Complacency in dealing with the epidemic and recklessness in its prevention.
- 3- Lack of awareness of their young age.
- 4- Non-distancing, lack of respect for safety distance, gatherings, sitting with each other, contact, touching and playing with each other.
- 5- Do not wear, remove or use the mask for several days without changing it
- 6- Exchange masks and borrow them from each other to be able to enter the institution.
- 7-Joint use of utensils and drinking water from one vial .
- 8-Do not wash hands.
- 9-Going out to play during the pandemic .
- 10-Failure to inform the administration in the event of the emergence of the disease at home .

Thus, we have tried to summarize the most important results that we investigated from the field research of the study in the two intermediate schools (Martyr Baaj Mohamed and Sharek Abdel Qader) in the city of Laghouat.

4. CONCLUSION:

This study dealt with the role of school administration in health awareness to prevent the spread of diseases and viruses and as a model of the Corona virus Covid 19, workers in educational institutions, including administrators, teachers and workers, have devoted all their efforts to confront this deadly disease by applying health awareness programs to prevent the virus because the latter is the best treatment for it is its prevention, efforts have intensified represented in the strict application of preventive measures and the mandatory

wearing of a mask, social distancing and the continuous use of sterilizers and disinfectants, in addition to advice and guidance through Seminars and publications, and this indicates the cooperation between the health and educational sectors to confront this pandemic and its negative effects and heavy losses humanly and economically.

Extracting from the above, we can highlight the importance of health awareness and spreading health culture among students for its importance in social life, and focusing on the effective role of the educational system in preserving and developing societies.
