Migration of skilled labor from the village should be limited by localizing pottery and ceramics industries in the village.

The number of eco-friendly hotels within the village should be increased to accommodate tourists and the number of qualified tour guides should be increased.

Efforts must be made to completely eradicate illiteracy among the village residents so that they can interact harmoniously and effectively with the tourism movement within the village. Additionally, efforts should be made to localize the clay industry used in pottery and ceramics within the village to avoid the high transportation costs associated with the industry.

– Environmental preservation is one of the most important goals of sustainable development. Therefore, products from workshops and artisanal factories should be recycled and reused for the productive villages and cities in Egypt, relying primarily on renewable energy sources and using eco-friendly materials in both industry and construction.

12 Recommendation

- Local governments must provide support for **:Strengthening government support** craft activities through policies that encourage heritage preservation and provide the necessary funding.
- Promotion efforts for craft products should be **:Promotion and Marketing** and internationally to increase marketing opportunities strengthened both locally, also It is essential to organize periodic exhibitions to showcase traditional products and attract tourists.
- It is necessary to provide training programs to improve **:Training and development** the skills of craftsmen and ensure the sustainability of craft activities.
- Sustainable environmental practices must be adopted at **:Environmental protection** all stages of production to preserve the environment and achieve sustainable development.
- **Organizing workshops:** Conducting workshops to teach traditional crafts, thereby facilitating the transfer of skills from older generations to younger ones.
- **Enhancement of Facilities:** Improving the infrastructure of villages, such as roads and transportation, to facilitate access to markets, also It is essential to ensure the availability of basic services such as electricity, water, and sanitation.
- **Registration of traditional crafts:** Efforts are being made to document traditional crafts as an integral part of Egyptian cultural heritage.
- **For the city of Fuwa in Sheikh-Kafr El Governorate:** A reuse approach for heritage buildings should be adopted as a primary means to achieve sustainable development within the city, transforming these buildings into workshops for teaching carpet and rug making, or as exhibitions to showcase products, in order to preserve these heritage buildings on one hand, and ensure their sustainability on the other, as well as to help revitalize the city's economy and maintain these traditional crafts from extinction such as the Tikeya and Al Rabaa buildings. Vocational training centers in the city should specialize in training for the production of handmade carpets and kilims, as they are the main trademark that the city is known for. It is necessary to establish specialized research centers in nanotechnology within the city, which will enhance progress in the textile production sector, as they will improve the properties of materials and grant them extraordinary functions, leading to a distinguished product that can compete in global markets. The workshops for weaving and carpets should be relocated from within the residential block and the heritage area to designated industrial zones for those workshops to preserve the integrity of the heritage buildings.
- **For the Village of Tunis in the Fayoum Governorate:** The unique environmental architectural style of architect Hassan Fathy should be adopted as the primary and sole style for all the village buildings to give them a unique architectural character that attracts tourism. The prices of handicraft products in the village should not be exaggerated to facilitate their sale to tourists. Additionally, centers for teaching foreign languages should be established to ensure easy interaction with tourists and to sell handicraft products to them.

11 Results

- Craft activities are considered an essential part of the sustainable urban development of heritage cities and villages in Egypt. By preserving heritage, enhancing the local economy, and achieving environmental benefits, these activities can contribute to the sustainable and inclusive development of local communities. The case study in Tunis village and Fuwah City shows how these activities can be integrated into urban development strategies to achieve sustainable development goals.
- The bottom-up gradual development approach is more cost-effective if implemented correctly, due to the precise allocation of resources and efforts towards the needs of the local community. It is also the fastest and most flexible in implementing small projects and programs if executed effectively.
- A development strategy can be implemented at the level of all Egyptian heritage villages and cities with an artisanal character, derived from the principles of sustainable urban development based on the experiences of the case studies in the research (Tunis Village in Faiyum Governorate – Fuwah City in Kafr El Sheikh Governorate). this strategy can be implemented in 4 phases with a time interval of two years so that the strategy is fully applied within a time frame of 7 years as stated in the research.
- All Egyptian heritage villages and cities could be productive and sustainable cities and villages with multiple activities that are not limited to agricultural activity alone, but extend to agriculture, craftsmanship, and tourism according to the nature of those villages and cities and the activities available there.
- Architecture, which is one of its manifestations, is the distinctive and unique architectural style that can be acquired by a village or city. It is one of the most important tools that can contribute to the tourism attraction of those heritage villages or cities and achieve significant economic returns for the local residents.
- Proper planning of heritage villages and cities in Egypt, along with a focus on the correct distribution of land uses, leads to the preservation of heritage and the stimulation of tourism.
- The reuse of historical and heritage buildings in Egyptian villages and cities as museums or exhibition halls displaying products is a successful and effective means that contributes to the preservation of the heritage building and its sustainability, as well as helping to maintain traditional crafts from extinction.
- The establishment of vocational schools and training centers within cities and villages with a heritage craft character is one of the most important means of developing the skills of Egyptian artisans and preserving these crafts from extinction.
- The establishment of state-run craft exhibitions such as "Our Heritage" and "Our Homes," and empowering artisans to participate directly in these exhibitions, eliminates the role of the intermediary trader in the handicraft industry, allowing these crafts to reach consumers at a low and affordable price.
- It is not possible to correctly initiate a sustainable development process for the Egyptian heritage villages and cities with a craft character without creating a comprehensive geographic database for all those productive Egyptian villages and cities as a first step, and expanding the role of local authorities and civil society institutions in supporting the economic, urban, and social development of the productive Egyptian villages and cities.

ecosystem, which includes saving energy and reducing local emissions within the village in sectors Residential.

12-Relying on environmentally friendly means of transportation, building materials, and environmentally friendly urban designs within productive Egyptian heritage villages and cities, expanding the scope of areas dependent on waste recycling to reduce their negative impact on the environment, developing the agricultural system in agricultural lands located on the borders of the village, and encouraging organic agriculture in them to maximize their benefit.

13-Relying on modern, environmentally friendly architectural styles within productive Egyptian villages and cities takes into account the provision of climatic comfort for humans without the need to consume electricity, such as Hassan Fathi's architectural style. It also requires emphasis on applying environmental requirements and maintaining environmental balance.

14-The government adopted the reuse of some historical and heritage buildings in Egyptian villages and cities in the form of museums displaying the development of the craft, and the reuse of other historical buildings to be exhibition halls in which products are displayed.

-The fourth phase (to be implemented over 7 years) includes the following set of objectives and policies:

15- A distinctive and unique architectural character must be added to all productive Egyptian villages and cities, as this will attract many important figures, intellectuals, poets, and writers to reside there, which will attract attention to the productive villages and cities and shed light on them.

16- All Egyptian heritage villages and cities must be transformed into productive cities and villages with multiple activities that are not limited to agricultural activity alone, but extend to agriculture, craftsmanship, and tourism. They must also become sustainable villages and cities that reuse what they produce and become a brand in their own right, such as Tunisian pottery and Siwa dates. And carpets, kilims, Fuwah, Saqiyat Abu Shaara, Tin Shammash, and others.

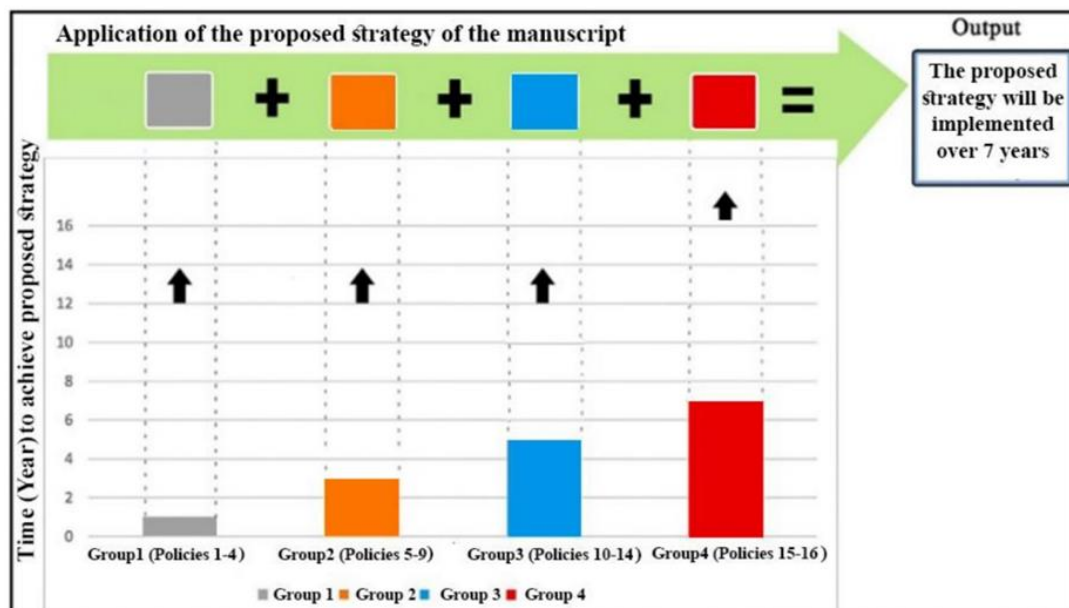

Fig. 5: Proposed Development Strategy for Urban Environments at the Level of Craft Character Villages and Heritage Cities in Egypt. Source: Author.

-The first phase (to be implemented over one year) includes the following set of objectives and policies:

1-A comprehensive geographic database must be created for all productive Egyptian villages and cities, and the role of localities and civil society institutions should be expanded in supporting the development of productive Egyptian villages and cities economically, physically, and socially [33].

2- The tasks of local units must be developed and the relationship between them and civil society institutions must be strengthened in contributing to the advancement of productive Egyptian heritage villages and cities.

3- Sustainable thinking must be encouraged in the process of making handicrafts and industrial activities in Egyptian cities and villages that have a heritage craft character by recycling the products of workshops and craft factories and reusing them again.

4- Spreading the culture of festivals in all Egyptian villages and cities that have a traditional craft character, as exhibitions of craft products such as ceramic products, and handmade cars.

-The second phase (to be implemented over 3 years) includes the following set of goals and policies:

5-Local units in all productive Egyptian villages and cities must establish craft schools to train people in the craft industries that distinguish each village or city.

6-Egyptian villages and cities with a traditional craft character must adopt a progressive development method from the bottom up and not the other way around so that it comes from deep within the Egyptian countryside and its villages. Therefore, we must not impose fixed visions on people and design their lives for them, but rather help them develop their lives and themselves according to the conditions of their environment and their capabilities.

7-The government must increase training centers to teach craft industries in Egyptian villages and cities with a heritage craft character, as well as develop the skills of Egyptian craftsmen and support them with the latest technologies.

8-The role of the intermediary merchant in the handicraft industry in Egypt must be abolished by the state holding handicraft exhibitions such as the Our Heritage and Our Homes exhibitions and enabling craftsmen to participate directly in those exhibitions.

9-Permanent exhibitions must be established at various levels: village - city - center governorate - republic, to promote the production of craft and handicraft industries in villages and cities. These industries must also be promoted regionally and internationally to transform all of Egypt into a sustainable environmental factory.

-The third phase (to be applied over 5 years) includes the following set of goals and policies:

10-Handicraft and handicraft workshops in productive Egyptian villages and cities must be moved outside the heritage area and residential bloc, and industrial areas must be provided to move these workshops too, as workshops are considered one of the factors of the lack of quality of life in the areas in which they are located.

11-Adopting the use of renewable energy sources, as one of the mechanisms of sustainable development, and activating the role of solar cells in many productive Egyptian villages and cities, especially in street lighting and inside hotels and some homes that depend on the

	projects that are under the supervision of the national government. The planning and approval processes for major projects take a long time before actual implementation begins. Complex and large projects can take years to complete, especially if they require significant changes to urban infrastructure.	communication with the community and faster prioritization. Projects that stem from community initiatives can be implemented more quickly as they are directly guided by the residents and local entities. This method allows for rapid adaptation to changes and better meets urgent needs.
--	--	---

It is clear from the comparison between the two alternatives that it can generally be said that the bottom-up gradual development approach (the second alternative) is more cost-effective if implemented correctly, due to the precise allocation of resources and efforts towards the needs of the local community. It is also the fastest and most flexible in implementing small projects and programs if executed effectively. Therefore, the second alternative has been chosen as the adopted method for the proposed development strategy for Egyptian cities and villages with heritage and artisanal character, which is applied in four phases starting from the establishment of databases for all Egyptian villages and cities with a heritage character and identifying local needs, up to the fourth phase where the distinctive architectural character of all the producing Egyptian villages and cities is finalized, transforming them into sustainable villages. Each phase requires the implementation of a set of policies and objectives, and upon completion, the transition to the next phase occurs. A proposed timeframe has been established based on the nature of the policies to be achieved in each phase. The expected timeframe from the research for spreading the culture of sustainability understanding local needs and establishing databases for producing Egyptian villages does not exceed one year. However, if the policies are related to establishing a set of artisanal schools or training centers or converting some heritage buildings into permanent exhibitions or relocating a number of workshops outside the heritage area, the research suggests that these policies should be implemented within a timeframe of two years due to the complexity and expected duration for such constructions or the processes of reusing heritage buildings or relocating artisanal areas outside the heritage zone.

After studying the two proposed alternatives from the research as suggested methods for development.

In addition studying the strengths, weaknesses, threats, and opportunities (SWOT analysis) of both Tunis Village in Faiyum and Fuwah City in Kafr El Sheikh, and after confirming the prominent role that artisanal activities play in driving the development process, the research proposes a development strategy suitable for application at the level of all Egyptian heritage villages and cities with an artisanal character, derived from the principles of sustainable urban development based on the experiences of the case studies in the research (Tunis Village in Faiyum Governorate – Fuwah City in Kafr El Sheikh Governorate). The research suggests that this strategy be implemented in 4 phases with a time interval of two years so that the strategy is fully applied within a time frame of 7 years as follows:

	allocation of resources based on national priorities [30].	making, which fosters a sense of ownership and responsibility towards development projects. 3. Achieving social justice: It contributes to a more equitable distribution of wealth, focusing on the less fortunate groups [31].
Disadvantages	1. Loss of flexibility: It may lead to a loss of flexibility in responding to changing local needs. 2. Lack of interaction with communities: It can lead to neglecting the needs of the local community and its participation in decision-making. 3. Risks of corruption: It may increase opportunities for corruption and mismanagement if there are no effective oversight mechanisms.	1. Coordination challenges: Governments may face difficulties in coordinating efforts among different local communities. 2. Limited capacities: Some local communities may lack the resources or capabilities needed to implement projects effectively. 3. Likelihood of unsustainability: If there are no clear strategies for ongoing support, projects may face difficulties in sustainability[32].
Cost	This approach tends to be more costly due to the large and complex nature of projects carried out under the supervision of the national government. Significant investments in infrastructure and major projects require the allocation of huge financial resources by the national government. Administrative and supervisory costs may be higher in this approach due to the strong necessity for strategic planning and national oversight.	This approach is generally less expensive due to the active participation of the local community and the use of available local resources. Projects that originate from community initiatives can be less costly because the needs and priorities are directly guided by the residents. Local resources and community collaboration can be relied upon in project implementation, which reduces additional costs that may be associated with large administrative procedures.
Time	This method can take a long time to implement large	This approach is the most time-effective due to direct

TABLE 2: COMPARISON BETWEEN THE TWO PROPOSED ALTERNATIVES FROM THE RESEARCH TO ACHIEVE DEVELOPMENT IN EGYPTIAN VILLAGES AND CITIES WITH A HERITAGE CRAFT CHARACTER. SOURCE: AUTHOR

Comparison Aspects	First Alternative	Second Alternative
The adopted development approach	A gradual top-down development approach, also known as hierarchical development, is a method that focuses on decision-making and directing development policies from higher to lower levels. In this model, goals and general policies are set by the government or higher authorities, and then implemented at the local community level[29]	A gradual bottom-up development approach that focuses on involving local communities in the decision-making and development process, where needs and priorities are determined by individuals and groups at the grassroots level, rather than having policies imposed by higher authorities.
Method of Development Approach	Interest and investment begin from the government and relevant authorities at the national level, and priorities and targeted key projects are determined by high-level government entities and implemented in cooperation with local authorities and local communities. This approach relies on the state's strategic planning and the national vision for development.	The needs and development projects are determined by local authorities and local residents, where local residents play an active role in identifying what they need and improving their urban environment. These needs are escalated through local authorities to the government and relevant higher authorities, which implement targeted development projects based on the vision of the local community that hosts the heritage.
Advantages	1. Unifying efforts: Contributes to unifying efforts and resources towards achieving predefined goals. 2. Policy coordination: Allows for the coordination of policies between different sectors and regions. 3. Resource allocation: Enables more efficient	1. Meeting community needs: This approach allows for a better understanding of the local community's needs, leading to the development of projects that align with those needs. 2. Enhancing participation: It encourages local residents to participate in decision-

	The carpet and kilim industry is centered in Fuwah at the Diwan market, which was the origin of the handmade kilim known for its renowned quality, colors, and distinctive patterns.	famous for having several qualified tour guides.
Threats	- Only a small number of workers are involved in producing handmade kilims because the craft does not generate sufficient income - Due to the decline in marketing and sales operations and the high prices of raw materials, a large number of workers and skilled artisans abandoned it and turned to construction and architecture work - The presence of kilim and carpet workshops within the residential block and the heritage area leads to a negative impact on the integrity of the heritage buildings due to the vibrations and noise produced by these workshops.	- The spread of illiteracy among the villagers. - The reliance on the clay used in the production of ceramics and pottery from Aswan exposes the craft to transportation costs.

10 Proposed Development Strategy for Urban Environments at the Level of Craft Character Villages and Heritage Cities in Egypt

To develop a feasible growth strategy for Egyptian cities and villages with a heritage crafts character, two alternatives were considered and studied in detail, followed by the selection of the best alternative in terms of ease and flexibility of implementation, time frame, and lower cost for its application. The first alternative adopts a top-down gradual development approach (development strategies start from the higher authorities in the state and the relevant government agencies, leading to their implementation at the local community level), while the second alternative adopts a bottom-up gradual development approach (starting from identifying the development priorities of the local community that hosts the heritage and crafts, leading to the implementation of those projects by the relevant higher government authorities). This can be illustrated in the following table.

	relationships with nearby centers and cities.	• A unique and distinguished productive community for Egyptian pottery art. • The vitality of the village and its economic growth due to the absence of unemployment.
Weakness	• The unsustainability of the reuse processes for both the Tikeya and Al Rabaa buildings can be attributed to the mismatch between the new purpose and the local community's needs • The city has a unique vocational training center with training workshops for several crafts, but it does not include training in carpet and handmade kilim production.	• Utilization was insufficient for the village's tourism potential • The exaggeration in the prices of the village's handicraft products makes it difficult to sell them to tourists. • The lack of centers for teaching foreign languages to the village residents makes it difficult to interact with tourists and sell them handicrafts.
Opportunities	• Conserve the traditional crafts of kilim and utilize them to promote tourism • Creating employment opportunities and maximizing economic benefits through the redevelopment of historic buildings and buildings with distinctive architectural character • World heritage programs like "Museum with no frontiers" have promoted tourism and enhanced economic gains • Development projects aimed to enhance the resilience of heritage buildings • Recently, advancements in nanotechnology have provided vast opportunities for its application in the textile sector, aimed at improving the properties of materials and granting them extraordinary functions that lead to a distinguished product.	• Utilizing the unique architectural style of the region and benefiting from it in tourism development. • Preserving traditional crafts of pottery and ceramics and utilizing them for the economic development of the village • Creating job opportunities and reducing migration for the village residents while maximizing economic benefits through localizing pottery and ceramics industries in the village • The diversity of pottery production in the village and its resistance to imitation led to the success of the pottery and ceramics craft in Tunis Village and its transformation into a sustainable ecological village. • The village includes several eco-friendly hotels, a caricature museum, and a school for teaching horseback riding. The village is

succeeded in changing the life of the village from a completely agricultural community to a agricultural, craftsman and tourist community, and from a closed community to a -multi community that communicates with everyone to display and sell its products inside and outside Egypt.

Handicrafts and tourism are intertwined. When handicrafts exist, there is a square where the - for the village of Tunis, pottery place becomes touristically active the profits of the artisans. As is the main motivation for tourists to visit the village.

Fig. 8: The craft of kilim and carpet making in the city of Fuwa.(Sheikh Governorate-Kafr El)
Source: Author.

9 Analysis and comparison between the two cases of the study

Both Tunis Village and Fuwa show a positive impact of craft activities on sustainable urban development. They both contribute to preserving cultural heritage and stimulating the local economy, but differ in the specific areas these activities affect.

Both cases contribute to the preservation of cultural heritage, but the **Cultural Heritage** methods of preservation differ; In Tunis village, traditional pottery techniques are preserved, while inFuwah weavingtechniques are preserved .

In Tunis village, activities focus on promoting pottery and expanding markets, while **Economy** scale industries-in Fuwah, craft activities promote cultural tourism and support small.

Both cases contribute to protecting the environment, but through different **Environment** methods that suit the nature of each industry.

TABLE 1: SWOT ANALYSIS FOR FUWAH AND TUNIS.

	Fuwah	Tunis
Strength	- Handicrafts represent the city's economic foundation - The city Enrolling in a Museum with no Frontiers initiative affiliated with UNESCO - The distinguished location of the city of Fuwah on a main road has led to the flourishing of trade in the city and exceptional	- The unique environmental architectural style of Hassan Fathy preserves nature. - The importance of the village for tourism stems from its unique location on Lake Qarun and its fame for producing unique ceramics and pottery.

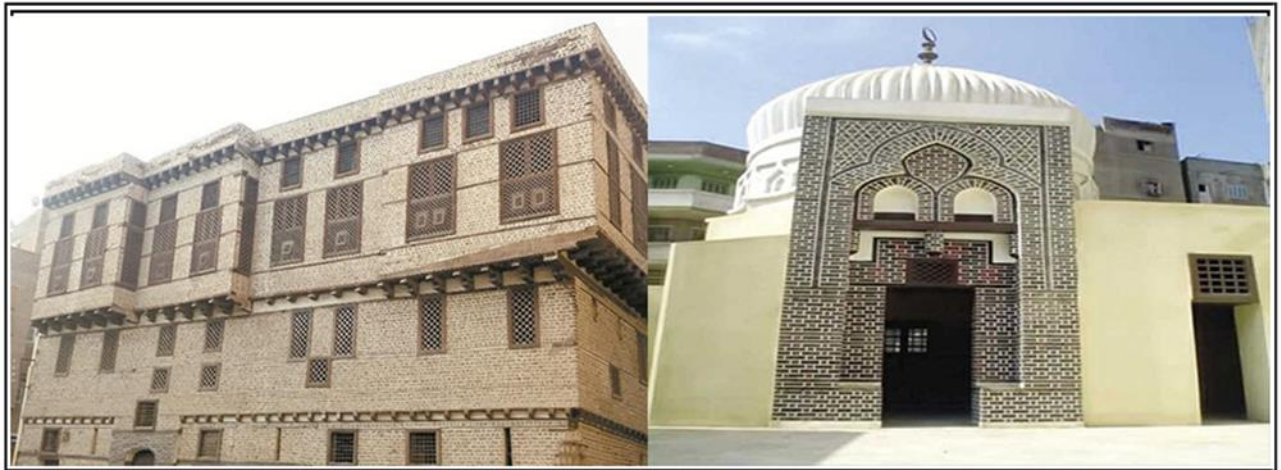

Fig. 7: The architectural character of the heritage of Fuwa city.(Fayoum Governorate) Source: Author.

8.2.3 activities in supporting sustainable urban development in the city The role of craft of Fuwah-Sheikh-Kafr El

– From a planning standpoint, kilim and - carpet-making workshops must be moved outside the residential block and away from the heritage area in Fuwah due to their negative impact on the safety of heritage buildings as a result of the vibrations and noise resulting from these workshops.

– Sustainable thinking must be encouraged in the process of making handicrafts and industrial activities in the city of Fuwa by recycling the outputs of the spinning and weaving factories in rag carpets can be-Fuwa, where rag made from those outputs.

s road networks whether 'Attention must be given to a comprehensive reform of the city The development of crafts and handicrafts cannot be .automobile roads or pedestrian paths stimulated without good, paved, and planned road networks.

which in turn will lead to increased commercial activity in the city.

Providing job opportunities for the residents of Fuwah by exploiting the available economic resources, as the city has workers trained in the craft of making kilims and carpets.

-Sheikh Governorate, especially sheep, must be exploited to provide high-Livestock in Kafr El quality wool that can be exploited in the handicraft industries of kilims and carpets.

that specialize in making designs for the manufacture of handmade carpets and kilims must be s historic houses' increased by reusing some of the city.

s historical buildings as museums displaying the development of the 'Reusing some of the city - craft of kilims and handmade carpets, and reusing other historical buildings to be exhibition halls displaying carpet and handmade kilim products.

Increasing the number of training centers in the city by exploiting vacant lands and dilapidated - buildings adjacent to the heritage area to develop the city's products of kilims and handmade carpets and protect the craft from extinction, provided that the designs of these centers are compatible with the distinctive architectural character of the heritage area.

Involving the local community in projects to reuse heritage buildings as exhibitions and training centers for the craft of carpet and kilim making ensures the sustainability of these projects and increases community awareness. It also helps preserve the craft and generates economic resources for maintenance.

8.2 Fuwah City.(Sheikh Governorate-Kafr El)

8.2.1 An introductory overview of the city

The city of Fuwah belongs to the Kafr El-Sheikh Administrative Governorate , and it is called the City of Mosques. It is considered the capital of the Fuwah Center and is 181km away from on the eastern shore of km away from the city of Alexandria. The city is located 89 Cairo and the Rosetta Branch.

In 2000, UNESCO selected it as part of the Museums Without Borders organization and classified it as a natural reserve, as it is ranked third in containing Islamic antiquities after Cairo and Rosetta. It is ranked fourth in the world in Islamic antiquities, which represent most of the . different Islamic eras, and its Islamic antiquities are varied to include (corners shrines, and hospices). In 1993, the Ministry of Culture launched a project to rescue and develop the ruins of Fuwahto make the city an open international museum. It also appealed to the specialized national councils and the International Council of Arts and Letters to consider the city of Fuwah an archaeological reserve.

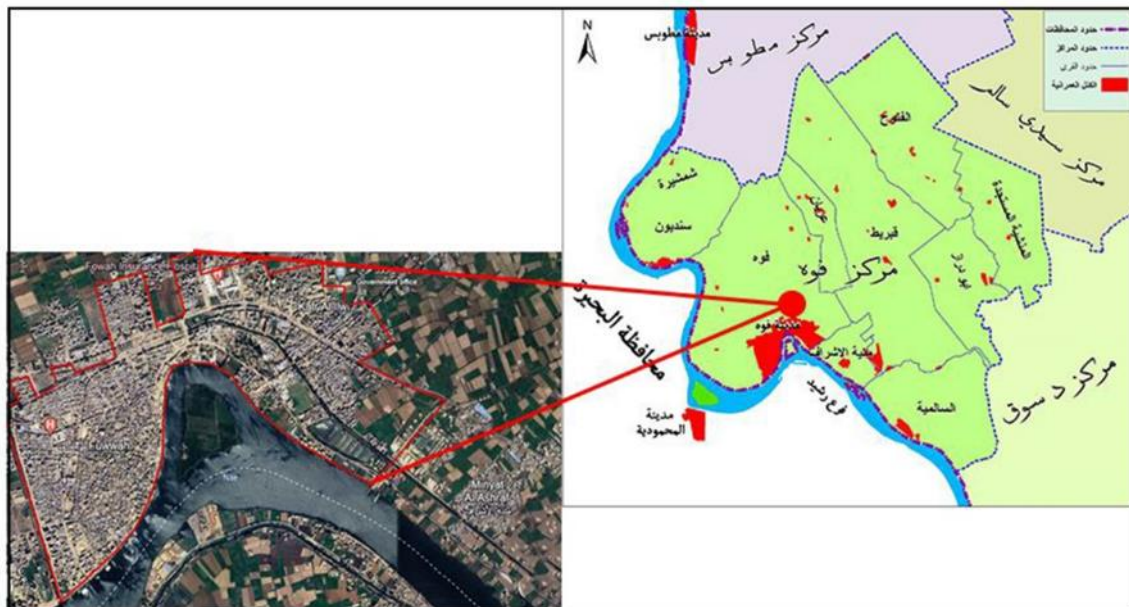

Fig. 6: Location of the study area (Fuwah Sheikh Governorate-city, Kafr El).

Source: Topographic map of Egypt 1: 100,000, Google Earth satellite image SASPLANET 2021 program.

8.2.2 Sheikh-Craft activities in the city of Fuwah, Kafr El Impact on sustainable urban) (development

- The handloom weaving industry in Fuwah maintains **In terms of preserving heritage** s cultural identity'ancient traditions and is considered part of the city.
- These activities enhance the local economy by **In terms of developing the local economy** job opportunities and enhancing the cultural tourism industry providing.It also supports small and medium enterprises in the city.

The traditional textile industry relies on natural **In terms of preserving the environment** - the environment compared to large industrial activities. raw materials and can be less harmful to This industry also offers innovative solutions to reuse materials.

8.1.3 development in the village The role of craft activities in supporting sustainable urban of Tunis

as this industry ranks third in terms of the percentage of workers in the village, who studied - at the school of the Swiss potter Eveline Boria. Then the first generation graduated from the school and each of them opened his workshop, followed by the second generation until the village became an art gallery. Large ceramic and pottery-making workshops. Also, a large s women work on producing simple handicrafts and crafts that are 'percentage of the village s bazaars. Tourists come specifically to buy these products, which helps 'displayed in the village develop the economic situation of the village in addition to raising its family budget [26].

s work in village handicrafts and their 'Sustainable development is achieved through women - participation in supporting the economy, closing the gender gap in work, helping to end .health care and food security poverty, and achieving

Income levels in the village can be increased by opening new markets for handicraft products and raiding small and medium enterprises such as places that sell handicrafts, etc.

Handicrafts in the village of Tunis help limit the migration of villagers to neighboring cities because of the job opportunities they provide[27].

Supporting craft and handicraft industries and preserving their continuity as an authentic s identity leads to the preservation of heritage buildings 'heritage that distinguishes the village in the village.

including the Tunis Ceramic and Handicrafts Festival and the Festival of the Sun , Perpendicular to the Holy of Holies in the Qasr Qarun Temple, where exhibitions of handicraft products and handmade carpet products are held on the sidelines of products such as ceramic s 'these festivals, which works to increase the economic and social development of the village residents. [28]

The establishment of centers for teaching foreign languages to village residents should be - supported to facilitate dealing with tourists and selling handicraft products to them.

should not be exaggerated because they are easy to sell to tourists and leave a good impression on them, which will lead to repeat visits to the village again and thus revive the economic income of the village residents.

As a result of the diversity of pottery production in the village and its inimitability, it led to - the success of the pottery and ceramic craft experiment in the village of Tunis and its transformation into a sustainable environmental village.

By measuring the general principles set by the state to achieve sustainable development within the Egyptian environments to achieve the three basic dimensions of sustainable development - the social dimension -the economic dimension)andthe environmental dimension), it is possible to determine the current status of the development of urban areas of all types [25]

- proposed principles for achieving urban sustainability, which are as follows:
- There is no sustainable global environment without a sustainable built environment
- Circular urban planning is better than linear planning and is necessary for resource recovery.
- There cannot be urban environmental solutions without alleviating urban poverty.
- There can be no lasting solution to poverty and environmental degradation without a strong civil society and new land use.

There cannot be urban transformation without Changing old operating systems and business rules.

- Forming cooperative partnerships between common sectors.
- Connecting the local community to the global one through independent communication networks.
- There can be no sustainable city in the 21st century without social justice and political and environmental revitalization participation, as well as economic efficiency.
- Sustainable development aims to achieve a balance between different and sometimes contradictory needs on the one hand, and awareness of the environmental, societal and other hand economic limitations that we face as a society on the.
- Sustainable development is a method of change in which:
 - Resource exploitation
 - Directing investments
 - Directing technological development
 - Institutional change in harmony to enhance current and future capabilities to meet aspirations people's needs and.

The following is a case study that was applied to the village of Tunis and the city of Fawah, due to their prominent craft activity and role in the urban environment of each of them.

8 Applied studies

8.1 Tunis Village (Fayoum Governorate).

8.1.1 An introductory overview of the village

Siddiq Center in -Youssef Al is one of the villages affiliated with the Tunis Village in Fayoum The village is located on the banks of .Fayoum Governorate in the Arab Republic of Egypt from the city of Fayoum, and more than 100 kilometers from the Lake Qarun, 60 kilometers The Tunis city of Cairo. The village includes 250 houses created by architect Hassan Fathi Village Ceramic, Pottery, and Handicrafts Festival is held, as the festival aims to promote the Village locally and internationally as a unique and distinguished productive community Tunis for the art of Egyptian ceramics, by holding an annual festival for Egyptian pottery and capabilities of handicrafts at a fixed date every year. The festival also aims to highlight the Fayoum Governorate. As a global environmental tourism destination.

that help achieve the dimensions of development Sustainable areas within urban areas can be summarized as follows:

- Achieving sustainable development requires **The principle of strategic planning** changes that are carefully designed to meet human needs over time political and institutional by taking the opinions of stakeholders to achieve the best results.
- implementable **The principle of setting realistic and visible goals for policies** goals are set to help determinethe numberof expected outputs or desired goals .
- **The principle of interconnection between the budget and strategic priorities:**The strategy must be included in the budget planning process to ensure the provision of financial resources until its objectives are achieved.
- It is the integration **The principle of integrated policy between different sectors** of the policy of all sectors, taking the environment and social impacts into account, with the framework of aim of integration and achieving the best possible development within a integrating diverse activities and their interaction at different social levels.
- It is based on all **The principle of raising awareness**people's understanding ofthe principle of sustainable development. Sustainable development will not be achieved except through cooperation among members of society in preserving current resources.
- This means providing the same **The principle of intergenerational justice** opportunities for future generations or better opportunities to meet their needs as the current generation, while fully monitoring basic human needs and their change over time.
- This principle calls for **The principle of preserving natural resources** rationalizing the use of natural resources to ensure the sustainability of development in a way that ensures the preservation of biological diversity, the protection of basic values, and an renewable energy resources with renewable resources to preserve the -attempt to replace non environment.
- This principle calls for the **The principle of fining the party causing the pollution** party causing the pollution to put pressure on the environment and must pay fees for causing this deterioration, as people feel that the cost of reducing pollution is an investment with a rewarding return.
- This is the extent to which sustainable **responsibility The principle of shared** sense of their shared responsibility towards 'development is achieved due to the beneficiaries reducing development pressures on the environment, natural resources, and society. Preventing pollution is considered more effective than treating **The principle of prevention** pollution, and therefore activities that pose a threat to the environment and human health are way that leads to avoided, provided that each of them is implemented and planned in a Creating the least possible change to the environment less risk to the environment and human health, reducing pressures on the environment and rational use of energy, production, distribution, and at sources of pollution. This principle is also applied use, reducing impacts on the environment through implementing environmental impact assessment and using the best available technology.
- Urban planning and **The principle of urban planning, development, and land use** considered a major tool for achieving sustainable urban development land use planning are.

burdens for future generations. These burdens are the result of the depletion of major resources, that is, the establishment of a balance between materials and energy, as well as financial inputs and outputs, which play an important role in all future decisions for development. Urban areas, been used since the eighties of the twentieth century, paved where the term sustainability has the way to the most common definition of sustainable development, as defined by the United Nations and Development Commission (Sustainable development) is the development that of the present time without compromising the ability of future generations to meets the needs meet their own needs, and it is the process of changing and exploiting resources to meet needs. Directing investments, the direction of technological development, and institutional changes that are compatible with future needs as well as current needs.

7.1 Dimensions of sustainable development

There are three main dimensions of sustainable development, which are as follows:

- development, including It includes economic **:The economic dimension** competition, economic growth, innovation, and industrial development.
- It is based on the strategy of achieving social justice equality **:The social dimension** among individuals, integration, and social stability.
- It is based on preserving environmental balance and **:The environmental dimension** the beauty of nature in light of achieving harmony between humans and the activities they practice within their surrounding environment.

two intellectual trends about The traditional concept of sustainable development involved s interest 'managing human or humanitarian activity. The first trend is based on development in achieving justice, while the second trend emphasizes that development should not threaten human life systems (do not threaten the interests of future generations.

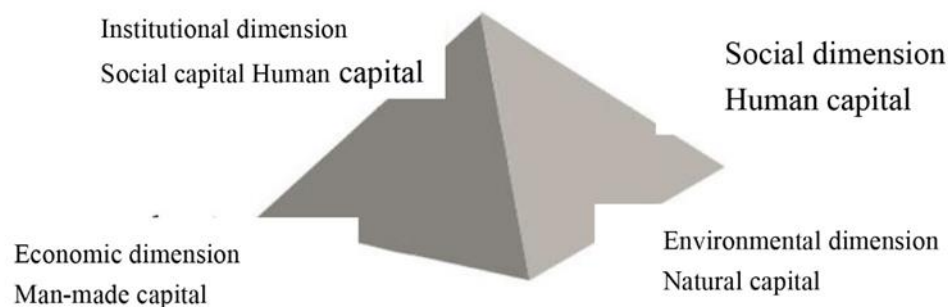

Fig. 2: The three main dimensions of sustainable development.

Source : (Spangenberg & Bonniot, 1998 and Valentin & Spangenberg, 1999)

7.2 Principles for achieving urban sustainability

Achieving sustainable development goals requires a coherent system that includes technological, economic and social policies in a comprehensive development plan. This plan ensures the employment of natural resources and human capitaleconomicallyto achieve economic growth aimed at improving the quality of life for the citizenswhile preserving the privacy of the environment and its natural resources for current and future generations. The state has established a set of guiding principles that can be used in developing effective policies

Some studies indicate that there is a direct relationship between local development in Egypt and financing and supporting handicrafts and heritage industries, as the success of local development depends in one of its dimensions on the ability to mobilize local resources through s means'one.

Several Egyptian financial institutions participate in financing projects at the local level. Such as the Nasser Social Bank, the Industrial Development Bank, the Egyptian Village Development Authority, the Local Development Fund, the national development banks in the governorates, private commercial banks, the Agricultural Development and Credit Bank, the Egyptian Village Development Authority, and the Fund for Supporting Rural and Environmental Industries and Rural Recovery.

In this context, this part of the study aims to analyze the reality of heritage and craft policies in Egypt at the initiative level to propose this policy, formulate it, and the active parties in it.

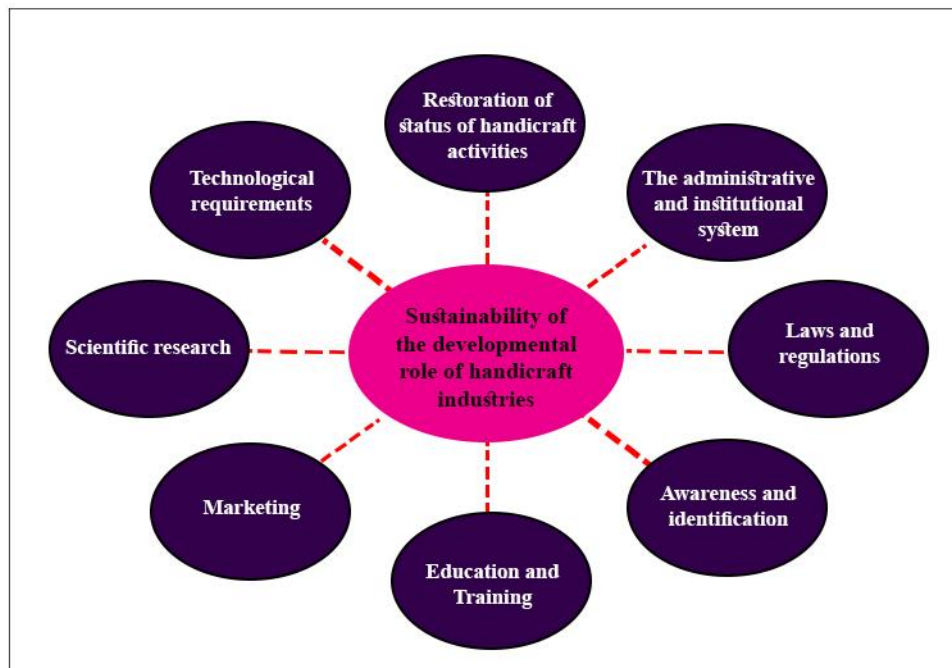

FIG. 1: STRATEGY FOR THE ADVANCEMENT OF HANDICRAFTS INDUSTRIES [24].

7 Sustainable development urban

Man lives in the environment and obtains the necessities of his life from its various components, s basic needs, improving his life conditions, and 'systems, and resources. Meeting man achieving his ambitions are among the main goals of development through the various activities he practices in the environment and its biosphere. In these activities, man is an active and influential element between the environment and development, and thus on him. To take into account the capabilities and capabilities of the environment to meet his needs and not harm them while carrying out his development activities, in addition to taking into account the continuity of the environment to meet the needs of future generations, as the idea of sustainable recommended in Rio de Janeiro 1992 and urban development appeared at the Earth Summit the right for every individual to own a designated space. For housing, the following definition of sustainable urban development appeared during the 21st Urban Conference:

Improving the quality of life in the city, includes, in addition to the urban aspect, the environmental, cultural, political, institutional, social, and economic aspects without leaving ,

- Demographic data and information containing population numbers, ages, types of economic activities, types of crafts and professions they practice, and unemployment numbers at different local levels.
- The applicable laws and regulations as well as the administrative methods applied encourage local economic activity and provide it with a safe environment[22].

6.3 The role of industries and handicrafts in local development

The geography and history of the place play a role in bringing about local growth through the power of innovation, and here we can rely on the Milieu Innovateur theory which is attributed to the theory of collective learning. Collective Learning small “This theory is linked to enterprises, where their innovative capacity increases because of their concentration in a common local area and their gathering in a place, which increases the potential for collective action through the intensity of social interaction and personal cohesion [23].

Therefore, there are many directions for local development, but this special part comes at the top. By employing and providing job opportunities, especially in the field of professions, crafts, and handicrafts Heritage.

emergence of industries and handicrafts is considered one of the products of the environment in which the population lives. The distinctive customs and traditions of each local opportunities for community that preserve its distinctive characteristics. Despite the increasing expansion of handicraft activities in third world countries, especially in those countries that have a long history and civilization, there are still many restrictions that hinder achieving the desired goal. development Since the definitions of local emphasize that it is a set of organized, coordinated, and sequential steps and a set of functions that are performed by individuals, structures, or bodies, manual and craft activities are considered at the core of local development because industries, handicrafts, and heritage contribute to achieving developmental justice and geographical balance between The regions of the country and each other contribute to reducing regional economic disparities, as these industries are characterized by flexibility in moving between regions and governorates, which helps in the emergence of limited markets and productive communities in those places. The nature of these industries is their ability to localize small industries, which reduces transportation and labor costs and increases the abundance resulting from craft concentration. Handicrafts and heritage industries also develop talent, creativity, and innovations through the technical and practical expertise of workers in those industries, which helps in discovering and then enriching human capital. The role of industries and handicrafts in the development of local communities is not limited to contributing to the local economy and benefiting from local savings, as they are a means of employing capital. In handicrafts and heritage activities and crafts play a role in promoting gender equality at the local level, as female participation rates in this industry are high. According to a study conducted by the Egyptian Center for Economic Studies.

In the international context, UNESCO stated after it gathered.

Egypt is one of the largest Arab countries in terms of the number and density of small and medium enterprises. Operating in it, as the number of these projects is about 2.45 million, and of the Egyptian gross domestic product. Small and medium enterprises they contribute 80% also constitute more than 90% of private sector projects and absorb between 65 to 75% of the workforce Union of Arab Banks, 2019.

resources in which he lives to transform them. For other subjects, preserving the identity of the community and the special characteristics of the environment. The local environment can management-employ women to contribute strongly to it, combining ownership and self[18] Industries and handicrafts also have a variety of objectives, ranging from economic, tourism, (cultural, and social.) .

6.2 Local development (concept and role)

The concept of local development has been known as part of the regional development concept growth, rediscovering local resources, relying on one's capabilities -contains meanings of self in the development process, and finding innovative solutions to local problems. The local development model assumes that it is based on four basic elements: local entrepreneur the activity of local institutions, expansion outside the local framework, and building a regional economic structure based on local initiatives [19]a “Local development is also meant to be -process in which partners from the governmental and business sectors, in addition to the non governmental sector, work collectively to provide better conditions for achieving economic ”growth and, by extension, urban growth and job creation[20]. This is evident through this The definition is that it takes into account a group of partners, i.e. actors from government who -Non can contribute strongly to local development.

the set of technical approaches and methods on which it “Local development is also defined as Local communities ”depends. are working units that attempt to combine external aid and efforts. Local self-organization is done in a locally directed manner in an attempt to stimulate the spirit of initiative and leadership in the local community. It is the main tool for bringing about ”change[21].

It can be noted that there are two elements on which local development is based: the extent of s participation each party The parties involved in bringing about local development, and the plans Local development is a subsystem extent of the existence of local development projects or -in the comprehensive development system, which is considered an integrated, multi level societal process that requires coordination between its various -dimensional, and multi sectors. Given the organic connection between comprehensive development and local development, the concept of local development must reflect the basic characteristics and dimensions of comprehensive development, but at the level of local parts and units. Local development. It means developing a place as an integrated regional system, regardless of its small size. It deals with rural or urban geographic units as planning vessels for identifying needs, analyzing problems, and then developing solutions. It is a group of processes, functions, and activities that aim to improve the level of economic, social, and cultural life of local communities and their citizens. The infrastructure for local urban economic development includes several things, as follows:

- Infrastructure such as security, road networks, sewage, water, communications railways, and .paved roads There are several educational and health institutions, the number of lands and their areas, and which .are most suitable for any activity
- Main services such as cultural and social services, grants, and assistance provided by the community itself.
- The latent capabilities in the local community that can be discovered to improve living standards and build local development projects.

- based on the prominent role of craft activities in advancing the development process and ,derived from the principles of sustainable urban development

5 Urban Conservation and Safeguarding Tangible and Intangible Cultural Heritage

Urban heritage conservation emerged in the second half of the 20th century as an essential division of international public policy to protect and safeguard future generations' cultural heritage. Urban heritage indicates a cultural property primarily associated with urban districts and historic cities, including sites, lands, blocks, street networks, land uses, and architectural buildings with their details and style [12].

In 2003, the “Convention on Safeguarding of Intangible Cultural Heritage” was the first to address intangible heritage that had only focused on tangible monuments and sites until that time. The 2003 convention defined the different intangible heritage parts, including social practices, rituals, and festive events. It aims to safeguard, respect, and raise awareness about intangible heritage and provide international cooperation to protect and promote the importance of communities, groups, and individuals' participation in protecting and saving their intangible heritage [13].

Since 2011, UNESCO has adopted a comprehensive approach that includes tangible and intangible heritage, embracing a city's historical economic, cultural, and social values. Historic Urban Landscape (HUL) has replaced the cultural heritage management approach as a city development base to improve and protect the human environment's quality and livability, aiming to integrate urban development with cultural management. This approach broadens the traditional model, focusing on managing heritage resources in continually changing settings and identifying interconnections between natural and cultural heritage, tangible or intangible.

6 Handicraft activities and local development (concept and role)

6.1 The concept of handicraft activities

Industries and crafts can be classified within the framework of small and medium enterprises. Craft activities are defined as” activitiesHis carried out by a craftsman based on his work ” individual mental and manual skills that he acquired from the development of his practice of craft work, using raw materials available in the local environment or imported raw materials, so that they are dealing with in production manually or using some simple tools“[14] quality -the activity or group of activities that produce high“and others know them as It is , goods without being governed by specific standards or systems ”[15] and arethose “ defined as activities that rely on manual skills of workers or that use only simple tools, and those activities into -manually -are based The main idea of the activities is to transform simple raw materials manufactured products that reflect a local heritage and cultural character, and are marketed as and these products carry heritage and religious expressions and ,”an economic commodity features in most cases[16]These are simple handicrafts that do not require many “as well as , machines or people, but they require skill and experience[17]Crafts and handicrafts are of great importance as they are among the activities that contribute to export, a source of foreign income, and the provision of hard currency, and are among the activities that Through positive ,propaganda to countries beyond their borderscontributeto providing job opportunities and participating in solving unemployment problems, as it employs large numbers of human resources with medium and low educational qualifications. It plays a developmental role in improving the local environment in which the craftsman works He may employ the local

planning, communities can achieve a harmonious balance between economic advancement and social as well as environmental objectives, thereby improving the quality of life and safeguarding cultural identity for future generations [6]. As Moreno (2020) explained, Cultural heritage plays an important role, particularly craft activities, as an essential asset for sustainable urban development. The study proposes that involving citizens in heritage-oriented storytelling cultivates community unity and inclusiveness, both of which are crucial for building resilient urban settings. Furthermore, the concepts of leveraging cultural heritage as a means for urban development can be effectively implemented in Egyptian cities and villages, thereby enriching their heritage identity and encouraging sustainable practices through active community participation [7]. Cultural heritage has the potential to propel sustainable urban development by utilizing local expertise and resources. In Egyptian cities and villages characterized by their heritage, craft activities can contribute to civic prosperity and stimulate urban renewal. By incorporating craft practices into urban planning, these regions can tackle economic and social issues, encouraging a harmonious coexistence of civic and economic objectives, thereby revitalizing historic centers As Aureli explained (2023) [8]. Sedky (2023) stated that Craft activities play a crucial role in the sustainable urban development of Egyptian cities and villages characterized by their heritage. They help preserve traditional skills and promote local craftsmanship. The incorporation of heritage crafts into urban planning strengthens cultural identity, bolsters local economies, and encourages community involvement. By repurposing historic buildings for craft production, these activities not only uphold architectural integrity but also generate employment opportunities, thereby ensuring the continuity of cultural practices while meeting contemporary urban requirements and sustainable development objectives[9]. Incorporating heritage into sustainable development is of paramount importance, with craft activities serving as a crucial element. These activities foster community involvement, safeguard traditional practices, and bolster the local economy, thus aiding in the creation of sustainable urban settings. By establishing guidelines for the preservation and oversight of heritage, these initiatives can effectively address the swift changes occurring in Egyptian cities and villages, ensuring that cultural heritage is maintained while simultaneously fulfilling modern social, economic, and environmental requirements As Magdi explained (2023) [10]. Abdelazeem (2023) stated that Recognizing the various types of workshops and crafts found in historical regions is crucial, as these endeavors play a significant role in the cultural and economic rejuvenation of heritage sites. By aligning local activities with the historical significance of the area, craft initiatives strengthen the community's connection to its architectural heritage and elevate cultural consciousness. This integration promotes sustainable urban development by nurturing local economies, safeguarding traditions, and ensuring that historical areas continue to thrive and maintain their relevance within the broader urban landscape[11].

3 Research problem

The research problem lies in how to apply sustainability concepts to craft areas within the framework of achieving the principles of sustainable urban development.

4 Research objective

- developing urban environments at the level of Reaching a comprehensive methodology for villages and heritage cities with a craft character in Egypt.

وخلصت الدراسة إلى توصيات تهدف إلى زيادة فعالية الأنشطة الحرفية في دعم التنمية الحضرية المستدامة في القرى والمدن المصرية.

1 Introduction

The role of culture as an approach to sustainable development has been recognized over the past decade as defined by UNESCO, cultural heritage includes tangible monuments sites, objects, intangible traditions, and living expressions inherited and passed on through the generations.

These include and are not limited to oral traditions, knowledge, practice, and festive events [1]. The Sustainable Development Goals (SDG) Article 4 under Goal 11 highlights protecting and safeguarding the world's cultural and natural heritage. Furthermore, sustainable cities and communities encourage positive economic, social, and environmental urbanization while considering heritage [2].

Additionally, in 2011, intangible traditions and social values were included in the Historic Urban Landscape approach (HUL), and in 2016, the New Urban Agenda "HABITAT III" was introduced.

This New Urban Agenda promotes and links cultural expressions, arts, and heritage-based activities to sustainable social-economic development; culture has become the fourth dimension when addressing sustainability [3]. The main focus of planners and decision-makers is to document and perceive the physical attributes of heritage. However, suppose any historic urban area would develop sustainably. In that case, a holistic vision should include the intangible dimensions besides the local inhabitants' livelihood, economic potential, and social structure [4]. Developing the physical attributes without including the society and the intangible dimension of heritage can lead to social exclusion, economic inequality, and the loss of identity. Therefore, this holistic management vision focuses on the HUL that reveals a community-based approach to heritage management [5].

s'considered the structural of the city Areas with a traditional craftsmanship character are heritage because of their great importance, as they have historical value and a distinctive urban and architectural character compatible with all environmental considerations and human needs by taking advantage of the available natural resources. Craft activity is a major activity that is part of the activities that make up the basic components of life for societies that express the culture and values of these societies. We find that a strong example of craft villages in Egypt is the village of Tunis in Fayoum because of its historical, architectural, social, and economic value, which requires attention and preservation to achieve urban sustainability for this distinctive village across future generations within the framework of implementing the sustainable development system .

2 Literature review

Rostami (2014) stated that Heritage has a significant role, particularly in craft activities, in promoting sustainable urban development. It underscores how these elements enhance social capital, strengthen community identity, and boost economic vitality. In Egyptian cities and villages characterized by their heritage, craft activities can enhance cultural well-being, stimulate tourism, and bolster local economies. By incorporating these activities into urban

The impact of craft activities on the sustainable urban development of Egyptian cities and villages with a heritage character

Case study of Tunis village in Fayoum and Fuwah city in Kafr El-Sheikh

Abstract

Craft activities are considered one of the basic pillars reflecting the cultural and historical identity of Egyptian cities and villages. They have a prominent role in promoting sustainable urban development, as these activities preserve the architectural heritage, strengthen the local economy, and improve the quality of life.

The research employs the inductive analysis method to study the impact of craft activities on sustainable urban development. It analyzes two case studies: Tunis Village in Fayoum and Fuwah City in Kafr El-Sheikh.

The research proposes a development strategy suitable for application at the level of all Egyptian heritage villages and cities with an artisanal character, to be implemented in 4 phases so that the strategy is fully applied within a time frame of 7 years.

The study concludes with recommendations aimed at increasing the effectiveness of craft activities in supporting sustainable urban development in Egyptian villages and Towns.

ملخص

تعتبر الأنشطة الحرفية أحد الركائز الأساسية التي تعكس الهوية الثقافية والتاريخية للمدن والقرى المصرية. ولها دور بارز في تعزيز التنمية الحضرية المستدامة، حيث تساهم هذه الأنشطة في الحفاظ على التراث المعماري، وتعزيز الاقتصاد المحلي، وتحسين نوعية الحياة .

استخدم البحث منهج التحليل الاستقرائي لدراسة أثر الأنشطة الحرفية على التنمية الحضرية المستدامة. ويحلل دراساتي حالة: قرية تونس في الفيوم ومدينة فوه في كفر الشيخ.

ويقترح البحث استراتيجية تنموية مناسبة للتطبيق على مستوى جميع القرى والمدن التراثية المصرية ذات الطابع الحرفي، يتم تنفيذها على 4 مراحل بحيث يتم تطبيق الاستراتيجية بالكامل خلال إطار زمني قدره 7 سنوات.
