* - Manipulative advertising refers to marketing strategies designed to influence consumer behavior through psychological tactics, often prioritizing persuasion over transparency. While these techniques can be effective, they may sometimes raise ethical concerns.

- This research confirms that the mental image of the brand can be confirmed using artificial intelligence applications to communicate brand values.
- There are many case studies that explained How prominent companies have leveraged AI to emphasize brand image.

Recommendations:

1. The need to include the teaching of artificial intelligence applications in advertising design education courses in Egypt.
2. The need to pay attention to the effective employment of artificial intelligence in the processes of confirming the mental image of the brand while adhering to the main brand values.

Results

- The power of AI to change consumer behavior remains a substantive gap in the philosophical discourse of AI in branding,
- This Research offers a distinct perspective on the intellectual magnitude and consequences of AI-driven brand image design, providing stakeholders with a deeper understanding of its strategic importance in contemporary branding.
- The power of artificial intelligence in marketing shaping the perception of the mental image of the brand.
- Artificial intelligence comes at the forefront of the peak of technological development in the field of advertising and marketing, so the main goal of using artificial intelligence in advertising and marketing is to support and confirm the mental image of the brand by creating a distinctive identity.

The Augmented Self:

The Impact of AI on Brand Identity and the Malleable Method As consumers increasingly rely on digital assistants that are powered by AI to navigate their brand decisions, the concept of a singular, stationary brand is increasingly complicated. Instead, brand identity becomes a dynamic that is influenced by AI, it is specifically designed to fit the unique preferences, habits, and biases of each individual consumer (*Belk, 2013*). This philosophical perspective on the augmented self and the malleability of brand identity has an effect on the ontological status of brands, the role of individual perception in brand recognition, and the ethical implications of AI-based brand personalization.

The use of AI in the creation and customization of NIKEiD, a customized product customization tool for customers, is another example of how (Nike) employs AI in its product customization strategy. The tool facilitates the creative involvement of customers in the production process by enabling them to design their own sneakers, strengthening their brand identity and sense of ownership (*White, 2020*). AI's duty in this context is not limited to providing operational capabilities but also involves enhancing the relationship between the brand and its customers, which is the essence of its role.

The Theoretical Interaction of AI and Brand Perception:

AI helps brands perceive their products more effectively by providing tailored experiences and predicting consumption patterns (Davenport, Guha, Grewal, & Bressgott, 2020). AI has the ability to manipulate the mental state of a product or service by enabling the development of targeted promotional campaigns that reflect consumer emotions and values (Luo, Xueming, Wieseke, & Han, 2020). These capabilities arouse a desire to delve into the philosophical underpinnings of AI's role in branding , the apprehension of AI in advertising concerns the philosophical implications of trust . AI's inherent value may no longer be based on trust in human elements but rather on the practicality and lawfulness of technological efficacy and integrity (Kim, 2022).

Using AI in designing the mental image of the brand/ Applied Study

The philosophy of artificial intelligence (AI) in rebranding involves leveraging AI technologies to analyze data, understand trends, and create innovative designs that reflect a brand's identity in a renewed way, the applied study rebrands Adidas, Nike and Big cola brands as follow: -

1- Nike Logo Designs:

loyalty and enhancing their relationship with them. (Schwartz et al., 2016) Artificial Intelligence and Chat Bots and Virtual Assistants (AI) can create a feel-good environment for brands, as long as the touch points are designed to be truly meaningful and supportive (Huang & Rust, 2018).

Figure 7 Starbucks creates their own AI platform, Deep Brew'

The Algorithmic Unconscious:

AI and the formation of brand images beyond the personalization of names, AI also participates in the unconscious processes that affect the formation of brand images. Through the utilization of Predictive Analytics, sentiment analysis, and other technologies that are powered by AI, brands can gain unprecedented knowledge of the psychology of consumers and the implicit connections, emotions, and biases that affect the perception of brands (*Schwartz et al., 2016*). This capacity to observe the "unconscious" of the consumer's mind raises questions about the autonomy of consumers' decisions, the transparency of brand influence, and the ethical use of AI in affecting the brand's image. The integration of AI in brand image formation represents a transfer of agency from humans to machinated (*Turkle, 2011*). AI's ability to act as a guarantor in decision-making processes raises concerns about the implications for consumer autonomy. Despite AI influencing the mental models of brands, there is a philosophical debate surrounding whether machine-generated decisions are sufficient to make sense for consumers.

Figure 8 AI and the formation of brand images

Given the significant impact of artificial intelligence (AI) on traditional marketing, brands must find a way to leverage this technology to enhance authenticity and relationship building for their customers. The balance between making consumer empathy and satisfying consumer satisfaction a priority is crucial, as establishing genuine, authentic relationships is key to achieving this balance, as empathy and satisfaction are closely linked to a brand's ability to establish genuine relationships.

Figure 6 Real Beauty Campaign

They're why Dove's 2004 Campaign for Real Beauty, which used real women instead of models, became so successful and was named the Best U.S. Campaign of the Past 20 Years. (

<https://www.frontify.com/en/blog/the-age-of-authenticity-why-brands-need-to-get-real/>)

1/Rethinking Authenticity in the Age of AI : Traditional beliefs about brand authenticity were based on the idea that a brand's authentic essence lies in a continuous history, values, and personality, while others involved a dynamic new identity, or a static brand, placed within an artificial domain or subset. Despite the onset of AI-led personalization and burgeoning brand experiences, the notion of authenticity must alter in light of the growing challenges facing modern brands and AI-driven personalization (Belk, 2013). AI should not be a formula for everything, it should be an avenue for creating meaningful and customized versions of a Brand's authentic self, allowing brands to step back from being constrained by a universal user interface (Huang & Rust, 2018).

2/ Fostering Transparent and Ethical AI Interactions: Ensure transparency and ethics in the utilization of AI-powered customer interactions is one of the most critical components of brand authenticity in an ongoing effort to harness AI. Consumers must be made cognizant of the fact that they are communicating with an AI system, not a human representative, and brands must be transparent about the technologies and benefits of their AI technologies (Culliford, 2020). The creation of AI systems that are free of bias and designed to provide fair and equitable experiences is crucial for brands to succeed in building trust and a genuine sense of care among consumers.

3/ Leveraging AI to Enhance Emotional Engagement : Leveraging AI can enhance brand emotional engagement, which can improve transparency and increase emotional resilience among consumers. By studying consumer data and behavioral patterns, brands can use AI to design AI-powered content, product recommendations, and communication strategies that resonate with consumers on a more emotional level, while also enhancing their brand's brand

Figure 5 Augmented Brand

1/ Enhancing Consumer Satisfaction through Augmented Branding: to boost consumer satisfaction are major drivers of AI-led branding efforts to improve consumer satisfaction, which is one of the many benefits it offers. The application of AI-based data analysis can help marketers tap into their audience's strengths, enhance their brand experience, and employ AI to improve their expertise across multiple touch points. Personalized product recommendations, individualized content and messaging, and efficient customer service through AI-based chatbots and virtual assistants are among the outcomes of this.

2/ Navigating the Ethical Considerations of Augmented Branding: The ethical challenges of utilizing AI and automation in branding may be subject to certain ethical considerations, especially with the rise of Augmented Branding and AI-powered approaches. Brands must promote transparency in their use of AI by making it clear to customers that they are using an artificial system and expect them to comply with their wishes (Culliford, 2020). Moreover, brands must aim to create AI-driven systems that are not influenced by any particular ideology or motivation, and are structured to provide fair and just experiences, thereby preserving the sense of genuine care and trust among consumers.

3/ Fostering Brand Empathy through Augmented Branding : Augmented Branding is not only about satisfaction but also about promoting brand empathy and emotional connections - it can be achieved through augmented branding, which helps brands feel more connected and responsive to their brand. Brands can improve their communication by utilizing AI to anticipate and evaluate consumer attitudes, tone, and behavioral tendencies, and using machine learning (Schwartz et al., 2016). The use of AI-generated content that is tailored to the consumer can result in a better understanding of their individual circumstances, challenges, and emotional well-being, ultimately resulting in a stronger sense of brand affinity and loyalty.

Authenticity and Brand Identity:

Brand identity? Is AI-led branding a hoax? AI's ability to generate custom brand messages based on personal preferences may lead consumers to question the authenticity of a brand's voice (*Tsai, Egelman, Cranor, & Acquisti, 2011*). Achieving a genuine representation of a brand's core values demands the balance between AI's personalised efficiency and the brand's underlying authenticity, brands must be able to maintain authenticity and build trust with a loyal customer base. The integration of AI in branding creates a paradox, as the more sophisticated and customized the branding becomes, the more it could seem artificial and undermine the brand's loyalty to its target audience (*Larsson & Heintz, 2020*).

deployment can foster their autonomy, and if and how they can use AI to fully capture and maintain the brand brand identity and influence.

1/ Transparency : The Importance of Transparency in Branding through AI One of the key ethical concerns of AI in Branding today is its Importance of a "Lack of Transparency and Authenticity" in brand-consumer interactions. The use of AI-powered chat bots, virtual assistants, or other AI-led brand touch points by consumers can create an artificial sense of connection and emotional triggers, which can lead to a brand-led emotional engagement that may not be authentic (Huang & Rust, 2018).

2/ The Bias Amplification Effect: The use of AI in branding raises questions about fairness and equity. AI systems can potentially propagate and augment existing biases in the data used to train them, (Schwartz et al., 2013), Brand experiences and marketing campaigns that are not aimed at specific consumer segments can result in the neglect or alienation of others. AI-mediated branding initiatives can significantly impact social inequality, adding to disparities in individualized product recommendations and advertising (Culliford, 2020).

3/ The Erosion of Consumer Autonomy: AI and Cognitive Outsourcing As consumers adopt AI-driven digital assistants, recommendation algorithms, and social media platforms to make informed consumer choices, they may experience a loss of their own autonomy and agency due to the influence of AI and cognitive outsourcing. Brands can utilize AI to subtly sway consumer decision-making, motivating individuals to select products or services based on their personal data and behavioral patterns (Belk, 2013).

The use of AI in "cognitive outsourcing" raises ethical questions about the potential impact on individual choices, the right to free will, the right to self-determination, and consumer abuse (Boden, 2017).

The Augmented Brand:

The rapid evolution of artificial intelligence (AI) has made significant changes in the realm of brand branding, resulting in a significant shift towards more human-assisted design, enhancing brand engagement and interaction with consumers. The use of AI in brand-building methods, known as "augmented branding," has a profound impact on consumer engagement and the formation of empathy for both consumers and brands.

AI and Brand Personification One of the most significant philosophical effects of AI in brand personality is the concept of brand personification, which suggests that brands can take on the human qualities and personality traits of their consumers through the use of AI-powered interfaces, chat bots, and virtual assistants (*Huang and Rust, 2018*). As consumers interact with these brand-related AI technologies, they begin to attribute human characteristics and emotions to the brand. This results in a confusion between the artificial and the genuine. This questions the nature of brand identity, brand-consumer interactions, and the ethics of brand personality.

generating personalized content and messaging that are relevant to their target audience. Achieving engagement, loyalty, and revenue can be the end goal.

3/ Using AI for branding offers the advantage of scalability, which cannot be replicated with pure data. AI-driven tools and technologies enable businesses to automate the repetitive work of other employees, freeing up time and resources that could be allocated to strategic priorities. AI can save businesses time and money by creating content or designing logos.

Nonetheless, these are not just imprecise advantages. Numerous companies have already utilized AI for branding purposes, with many of them utilizing AI. Coca-Cola employed AI to build a vending machine that would recommend beverages based on consumers' facial expressions, as demonstrated by the company. Nike employed AI to scrutinize consumer behavior and create a customized shopping experience that recommends products based on consumer preferences.

(https://medium.com/@tiffany_33974/the-role-of-ai-in-modern-branding-a-beginners-guide-574ba03f484b)

4/ AI's capacity to anticipate and process consumer preferences can result in pre-emptive shaping of consumer preferences (*White and Zhang, 2021*). Specifically, it is conceivable that this ability could theoretically shift the concept of desire from being a self-generated state to one that is becoming more and more ascribed to external factors, such as algorithms. This change has the potential to cause a transformation in the complexity and distribution of consumer-brand relationships, as it shifts the focus away from machines and towards a more machine learning-driven deterministic model of consumer behavior.

Figure 4 Calm App uses Amazon Personalize to increase app usage

Ethical Considerations:

The ethical aspect of branding with AI is a critical issue to address. When AI systems modify brand perceptions, data privacy (*Baruh, Secinti, & Cemalcilar, 2017*), manipulative advertising (*) (*Zuboff, 2019*), and accountability (*Martin, 2019*) are all issues that demand attention, leading to issues of accountability related to accountability. Brands must navigate these concerns to maintain trust and morality while managing their AI implementations. A fundamental ethical concern is the protection of consumer data and preventative measures, such as protecting the unreliable data of AI users and avoiding manipulation to gain an unfair advantage (*Nunan & Di Domenico, 2017*). The integration of artificial intelligence (AI) into the operations and marketing strategies of modern brands brings several ethical dilemmas. While AI has undoubtedly played a crucial role in enhancing customer experience and business processes, its implementation by brands has raised important philosophical and ethical questions about the true nature of relationship between brand and consumer, whether such a

Figure 2 AI's ability to influence brand perceptions

Advantages of using:

There are a lot of features that govern the application of the use of artificial intelligence in the brand that can be illustrated by the following chart:

Figure 3 AI for Branding

1/ Brand consistency across all channels and platforms is now possible thanks to AI-aided branding, which will be used across a range of AI-powered platforms. By analyzing patterns and analyzing data, AI can assist businesses in developing and preserving a consistent brand voice, messaging, and imagery. In today's global marketplace, consumers are able to engage with brands across a wide range of channels, such as social media, websites, and mobile apps, making this particularly crucial.

2/ Personalization can be enhanced by AI, as seen in the AI tool. AI can provide businesses with insights into customer behavior by examining patterns in consumer behavior and

Figure 1 Coca-Cola AI ads

Artificial Intelligence (AI) as a component of branding has a profound impact on consumer behavior by changing the philosophical stance of brand actors on operations. This alteration presents several vital philosophical consequences, a series of which are deserving of further analysis.

- First up, AI affects the reality of brand messages. With AI's ability to access and analyze mass data sets of consumers and create personalized content, there is a new ethical dilemma involving the authenticity of brand messaging (*Jones, 2022*). Philosophically speaking, this question casts doubt on the nature of authenticity in an age where AI has taken over the majority of communication. The task at hand is to find a way to communicate a unique message to a select number of potential customers without compromising brand values.

- AI's ability to influence brand perceptions is a significant challenge to traditional consumer agency notions. Consumers can experience a sense of nonconformity from AI-driven recommendations and personalized content, which can erode their autonomy and interfere with their natural selection process (*Smith, 2023*). This adds focus to philosophical concepts, emphasizing the need for AI to serve as both a navigator and an influence in consumer decision-making, while also ensuring that human cognition sets and values the goods.

In that respect, there is an even more profound sense in which it creates a mental picture of what brands represent— how it generates a perception of brands in consumers' minds without them having had any physical contact with the product or service being branded.

Research problem:

The research problem stems from the need to identify the philosophical dimensions of the role of artificial intelligence in designing the mental image of the brand.

Research Objective:

This research aims to monitor the philosophical dimensions of the role of artificial intelligence in designing the mental image of the brand.

Research Methodology:

The research follows the descriptive approach.

Research hypothesis:

The research suggests that exploring the philosophical dimensions of the role of AI in designing the mental image of a brand will enhance the design process of branding. Thus, influencing marketing methods, competition and the success of the brand in responding to the aspirations of the recipient.

2. The philosophical implications:

Branding is a symbol of the effects of Artificial Intelligence (AI) and its interconnected nature, so the philosophical implications of AI's role in creating the mental image of the brand are sizable, yet profound, beyond any single brand identity. The use of AI by consumers has transformed the way they interact with, think with, and think with brand identities, shifting the focus from the personification of brands to the algorithmic unconscious to the augmented self, all while retaining the qualities of older AI systems that could have been lost with the internet. The use of Artificial Intelligence (AI) in brand image creation has created new doors and philosophical questions. Despite the increasing ubiquity of AI, marketers and brand strategists must seriously consider the philosophical and ethical implications of new technological advancements in this area.

Coca-Cola leveraged AI from AI to generate highly personalized marketing strategies that accurately reflected consumer moods and trends, while also retaining a highly adaptable and appealing brand image, Whether or not AI is used to distinguish brand image is a philosophical question that requires a philosophical standpoint, not a technological one. It will be of increasing importance to maintain authenticity, maintain a balance of agency, and uphold ethical values as AI continues to mold the mental images of brands, building on the strength and complexity of the mental models created by our digital devices. The dialogue between AI and branding philosophy will be a developing conversation that will lead to a new discourse that will transform the future of brand identity and consumer interaction. *(Smith & Johnson, 2021)*

The philosophical dimension of the role of artificial intelligence in designing the mental image of the brand

Dr. Haidy Youssef Abou-Elgheit

Associate Professor at Faculty of Applied Arts – Benha University

haidy.youssef@fapa.bu.edu.eg

Abstract:

At the present time, we see the power and influence of advanced artificial intelligence in all fields, especially marketing, and especially in shaping brand perception, as artificial intelligence is at the forefront of the peak of technological and marketing development, so the main goal of using artificial intelligence in marketing was the desire of brands around the world to creating a distinctive identity, in order to create and enhance the brand image in global markets, as the branding strategy has become transformed into applications of artificial intelligence to communicate the brands' values. AI, as a technology that keeps advancing and progressively finding its way into numerous sectors of our lives, such as branding plus marketing. Its impact on these two fields is today being realized to be deeper than ever. There's more to AI than just helping in ensuring an effective marketing campaign using data or automating the way we interact with customers. In that respect, there is an even more profound sense in which it creates a mental picture of what brands represent— how it generates a perception of brands in consumers' minds without them having had any physical contact with the product or service being branded. The research concludes that This Research offers a distinct perspective on the intellectual magnitude and consequences of AI-driven brand image design, providing stakeholders with a deeper understanding of its strategic importance in contemporary branding. Also, the power of artificial intelligence in marketing shaping the perception of the mental image of the brand.

1. Introduction

Discovering practical applications of AI in brand image design through inquiry reveals not only impressive potential uses of AI across various industries, but also the potential of many fields. By examining case studies that demonstrate how prominent companies have leveraged artificial intelligence to manipulate brand perceptions, we uncover several compelling case studies that illustrate the power and incidence of AI in changing consumer behavior, Coca-Cola, a globally distributed beverage company, To develop and enhance brand loyalty and engagement by analyzing social media data, they redirected AI-powered tools to create custom marketing campaigns that reflected consumer preferences (*Johnson, 2019*). The main goal of using artificial intelligence in marketing was the desire of brands around the world to create a distinctive identity, to create and enhance the brand image in global markets, as the branding strategy has become transformed into applications of artificial intelligence to communicate the brands' values. AI, as a technology that keeps advancing and progressively finding its way into numerous sectors of our lives, such as branding plus marketing. Its impact on these two fields is today being realized to be deeper than ever. There's more to AI than just helping in ensuring an effective marketing campaign using data or automating the way we interact with customers.
