

The Relationship Between Marketing Strategies, Customers Satisfaction, and. Citizenship Loyalty in Egyptian Public Organizations

Walaa Sherif Mohamed Wasfy

PhD Researcher – Faculty of Commerce
and Business Administration
Capital University

Abstract

This study, entitled “The Relationship Between Marketing Strategies, Customer Satisfaction, and Citizenship Loyalty in Egyptian Public Organizations”, examines how governmental marketing strategies influence citizens’ satisfaction and loyalty. It is based on two hypotheses: (1) adopting effective strategies—such as transparency, service quality, and institutional branding—positively affects satisfaction, and (2) satisfaction mediates the relationship between strategies and citizens’ loyalty.

The theoretical framework combines Social Exchange Theory (SET), which views the government–citizen relationship as an exchange of benefits and costs, and the Unified Theory of Acceptance and Use of Technology (UTAUT), which emphasizes the role of digital platforms and ease of use in shaping perceptions. Using a mixed-method explanatory design, the study collected quantitative data from Egyptian citizens and complemented it with qualitative insights.

Findings show that marketing strategies significantly enhance satisfaction, which in turn fosters loyalty. However, contextual factors—such as political environment and institutional trust—moderate this relationship. The study recommends integrating transparent digital platforms and citizen participation to strengthen long-term loyalty.

Keywords:

Marketing strategies; Customer satisfaction; Citizenship loyalty; Egyptian public organizations; Digital platforms; Transparency

Introduction

In the contemporary era, digital transformation has become a strategic imperative for governments globally, aimed at enhancing public service delivery, improving operational efficiency, and, critically, restoring public trust. Often referred to as e-governance, this global paradigm leverages information and communication technologies (ICTs) to reshape the relationship between the state and its citizens, enabling more accessible, participatory, and transparent public services (OECD, 2014–2020). For developing nations facing systemic corruption, inefficiency, and low institutional trust, such transformations are both urgent and consequential.

Egypt represents a compelling case in the study of e-governance. Anchored in its broader sustainable development framework, the Digital Egypt initiative—integral to Egypt Vision 2030—seeks to modernize public services, enhance transparency, and elevate citizen satisfaction (MCIT, n.d.; Egypt Vision 2030, 2016; AEDIC, 2025). This initiative encompasses expansive digital infrastructure, including nation-wide fibre-optic networks and digital platforms facilitating public service access across online portals, mobile applications, call centers, and post offices.

Furthermore, the Organization for Economic Cooperation and Development (OECD) has positively assessed Egypt's progress, acknowledging institutional reforms in public governance—such as digitization, civil service modernization, and inclusive policymaking—while emphasizing the need for cohesive, whole-of-government approaches and system-wide coordination (OECD, 2025).

Literature Review

Citizen Trust and Loyalty in Public Administration

Citizen trust in government is widely recognized as a foundational pillar of a healthy democracy. It fosters public debate, encourages civic participation, and promotes compliance with laws and regulations (Organization for Economic Co-operation and Development, n.d.). Conversely, a decline in trust is often rooted in public doubts about the accountability and transparency of institutions, as well as a lack of responsiveness to citizen participation. The OECD Trust Survey, for example, measures confidence in public institutions and has found that trust varies significantly across countries, with a considerable portion of the population reporting low confidence in their national governments (Pew Research Center, 2024).

Citizenship loyalty, in the context of modern public administration, is a more complex and dynamic construct than the traditional notion of unquestioning obedience to the state. Contemporary public administration literature suggests that citizens, acting as "customers" of the state, base their loyalty on the perceived quality and value of public services (de Graaf, 2007).

This perspective is central to a key finding of Alkraihi and Ameen's (2022) study on e-government services, which revealed that citizen satisfaction, service quality, and trust are all significant factors in developing loyalty. Therefore, loyalty is not a given but is earned through a government's performance and its commitment to serving the public interest.

Government Transparency and Accountability

Governmental transparency is defined as the government's obligation to be open, accountable, and honest with citizens about its operations and the use of public funds (Granicus, n.d.). This obligation is fulfilled through proactive communication, providing easy access to information, and establishing mechanisms for public consultation and feedback. The purpose of such openness is to empower citizens with the information needed to make informed decisions and hold public officials accountable (Government Finance Officers Association, n.d.). This is particularly important for fostering credibility and ensuring that governmental processes align with public interests.

However, the link between transparency and trust is not always straightforward. While there is a general positive correlation between greater transparency and higher public trust, this relationship is not universally consistent (Ndemo & Mwanzia, 2023). Research indicates that transparency alone may be insufficient to rebuild trust that has been severely eroded by past misconduct or systemic failures. This highlights a crucial point: the mere provision of data, such as financial records or public meeting minutes, may not be enough. The effectiveness of transparency initiatives depends on the government's ability to provide information with sufficient context for citizens to evaluate the quality of public work, a process that can be both time-consuming and costly.

The Digital Transformation of Public Services and E-Governance

The adoption of ICTs by governments to improve services, enhance democratic processes, and empower citizens is a defining feature of modern public administration (Al-Mashhadany & Al-Mubarak, 2017). This transition, termed e-government, allows for the delivery of public services to citizens around the clock and from any location, thereby reducing bureaucracy and improving efficiency. From a citizen's perspective, the central purpose of this transformation is to provide opportunities for greater involvement in decision-making processes and to reshape the fundamental relationship between citizens and the state (Vigoda, 2002).

Egypt's national strategy, "Digital Egypt 2030," explicitly aims to achieve these objectives (Azeus Convene, n.d.). The plan emphasizes enhancing government digital transformation to increase citizen satisfaction and combat corruption. Key initiatives include the unified "Egypt E-Government Services" portal, which provides access to over 100 digital services, from passport applications to paying taxes. The strategy also focuses on developing digital infrastructure, promoting financial inclusion through mobile payments like Fawry and Vodafone Cash, and

fostering innovation and skills development. Reported successes include a 30% reduction in corruption in public services and the construction of technology centers.

Social Exchange Theory (SET)

Social Exchange Theory provides a powerful lens through which to analyze the citizen-government relationship (The Decision Lab, n.d.). The theory posits that human social behavior is an exchange process where individuals weigh the potential rewards and costs of their interactions (Verywell Mind, n.d.). In the context of public administration, citizens can be viewed as rational actors who continuously evaluate their relationship with the government based on a cost-benefit analysis (Gould-Williams & Davies, 2005).

The rewards a citizen seeks from this exchange include quality public services, protection of rights, a sense of belonging, and the opportunity for political influence. The costs involve paying taxes, complying with laws, the time and effort required to navigate bureaucracy, and potential emotional strain or perceived loss of autonomy. Loyalty, under this framework, is not a blind allegiance but a form of "conditional reciprocity". When a government provides effective, reliable, and transparent services (a favorable exchange of rewards), citizens are more likely to respond with higher levels of engagement, trust, and loyalty. Conversely, if a government's actions increase the costs—for example, through inefficiency, unaccountability, or perceived threats to privacy—the motivation for a citizen to remain loyal or invested in the relationship diminishes. SET is a robust framework for understanding why governments, which invest significant resources in digital platforms, may still face low levels of citizen loyalty if citizens perceive the costs of engagement to be too high.

The Unified Theory of Acceptance and Use of Technology

The Unified Theory of Acceptance and Use of Technology (UTAUT) is a model designed to explain user intentions to use an information system and subsequent usage behavior (NCL Open Learning, n.d.). It is particularly relevant for understanding the adoption of digital government services. The original UTAUT model is based on four key constructs:

- Performance Expectancy: The degree to which a user believes that using the system will help them attain gains in job performance or, in the case of e-government, will provide benefits and greater efficiency.
- Effort Expectancy: The degree of ease associated with using the system. In the context of e-government, this relates to the user-friendliness of the platform and the simplicity of its processes.
- Social Influence: The degree to which an individual perceives that other believe he or she should use the system.
- Facilitating Conditions: The degree to which an individual believes that the organizational and technical infrastructure exists to support system use.

Research has extended the model to the specific context of e-government by incorporating additional factors such as citizen trust in the government and trust in the internet itself as crucial determinants of adoption (El-Mekawy & Mostafa, 2022). This integration is vital for the current study, as it links the technical aspects of platform design to the broader, more abstract concepts of trust and public confidence. The model provides a systematic framework for testing the second research hypothesis by examining how platform characteristics and the surrounding socio-technical environment influence a citizen's decision to engage with digital government services.

The Egyptian Context: An Analysis of Digital Governance Reforms and Challenges

Egypt's digital transformation is a multi-faceted endeavor with ambitious goals. However, a comprehensive analysis reveals a dual-edged reality, where progress is often accompanied by significant challenges. The government's initiatives are largely top-down, state-led efforts, a model that contrasts with more bottom-up, citizen-driven approaches. While this top-down model has shown some success—a reported 30% reduction in corruption in public services and a 40% reduction in waiting times for registered users—it faces deeply rooted, systemic barriers (Naos Solutions, 2025).

A primary obstacle is a phenomenon that public administration researchers refer to as the "hard-soft gap" and the "private-public gap" (Alhujran et al., 2020). The former arises when e-government projects focus exclusively on technical aspects without considering the cultural and political context, while the latter occurs when governments attempt to implement systems designed for the private sector, which has fundamentally different goals and operational dynamics. Beyond these conceptual gaps, Egypt faces several practical and persistent challenges, which create a multi-layered digital divide that directly impacts the success of its e-governance strategy (Freedom House, 2024).

The Research Problem

Despite the clear strategic intent and significant investments in Egypt's digital transformation, a critical question remains: are these initiatives effectively translating into their desired outcomes of enhanced citizen trust and loyalty? The effectiveness of e-governance in a developing-world context is not a foregone conclusion (Mansoori et al., 2024). Public trust in institutions in many developing economies is already low due to issues of weak governance and instability. Moreover, simply replicating e-government systems designed for developed countries can lead to failure due to a lack of consideration for local factors such as culture, politics, and existing infrastructure gaps (Al-Mashhadany & Al-Mubarak, 2017). Therefore, the problem is to critically evaluate whether the mechanisms proposed in the research hypothesis—that transparency and digital platforms foster trust and loyalty—are fully functional within Egypt's complex and often contradictory socio-political environment. The study must move beyond a

simple, linear model of technology adoption and account for the countervailing forces that may impede the successful realization of these goals.

Research Objectives and Significance

1. To define and operationalize the concepts of governmental transparency, citizen trust, citizen loyalty, and digital service engagement within the Egyptian context.
2. To analyze the theoretical underpinnings of the proposed relationships using Social Exchange Theory and the Unified Theory of Acceptance and Use of Technology.
3. To synthesize and critically evaluate existing evidence regarding the successes and challenges of Egypt's digital transformation initiatives.
4. To identify and analyze the countervailing forces that may impede the successful translation of e-governance initiatives into enhanced trust and loyalty.
5. To provide a summary of the findings, a conclusion, and recommendations for future policy and research.

This research is significant as it contributes to the body of knowledge on public administration and e-governance in developing nations. By applying and extending established Western theoretical frameworks, such as SET and UTAUT, to a non-Western, transitional economy, it highlights the friction between technological progress and political reality. The study is particularly valuable for its nuanced analysis of how institutional and cultural factors can moderate the success of well-intentioned digital policies. The findings will provide crucial insights for policymakers, researchers, and international organizations working to implement and evaluate digital governance reforms in similar contexts.

Research Questions

This research is guided by the following core questions:

- To what extent does a higher degree of transparency and open communication by Egyptian governmental organizations positively influence citizen trust and loyalty?
- How do the use of user-friendly digital marketing platforms for public services and information dissemination affect citizen engagement and loyalty in Egypt?
- What are the major contextual factors—such as the digital divide, data privacy concerns, and government censorship—that moderate the relationship between the independent variables (transparency, digital platforms) and the dependent variables (trust, loyalty)?

Research Hypotheses

This study will test two primary hypotheses, which serve as the foundation for the analysis of the relationship between marketing strategies, customers satisfaction, and. citizenship loyalty in Egyptian public organizations.

Hypothesis 1 (H1): A higher degree of transparency of Egyptian governmental organizations, coupled with more frequent and open communication with citizens regarding policies, initiatives, and performance, has a positive and significant influence on the level of trust among the citizenry, which will subsequently lead to a greater sense of citizenship loyalty.

This hypothesis is based on the premise that a government that is open and accountable will foster a positive social exchange with its citizens. By providing clear information and demonstrating integrity, the government reduces the perceived costs for citizens and increases the rewards, thereby strengthening the foundation for trust and loyalty.

Hypothesis 2 (H2): The more effectively Egyptian governmental organizations leverage user-friendly and readily accessible digital marketing platforms to deliver essential public services and disseminate timely and relevant information to citizens, the greater the positive impact on citizen engagement with these organizations, ultimately resulting in enhanced citizenship loyalty.

This hypothesis examines the direct impact of technology on citizen behavior. It assumes that by reducing the effort required to access services (Effort Expectancy) and demonstrating the tangible benefits of using digital platforms (Performance Expectancy), the government can drive greater citizen engagement (Witarsyah Jacob & Darmawan, 2019). This enhanced engagement is expected to translate into increased citizenship loyalty.

The conceptual framework for this study posits a causal path from government actions to citizen outcomes, while also accounting for crucial moderating variables. The independent variables, Governmental Transparency and Digital Service Delivery, are hypothesized to have a direct positive effect on the mediating variables, Citizen Trust and Citizen Engagement, respectively. These mediating variables, in turn, are expected to lead to the ultimate dependent variable, Citizenship Loyalty.

Crucially, the framework introduces a set of moderating factors—specifically, the Digital Divide, Data Privacy and Security Concerns, and the socio-political climate of Surveillance and Censorship (Freedom House, 2024). These factors are not static but are active forces that can either amplify or, as this study suggests, significantly undermine the positive relationships between the variables. The framework visually represents the nuanced reality that a government's positive initiatives may be rendered less effective by its simultaneous implementation of restrictive policies.

Methodology

The methodological framework adopted to investigate the intricate role of marketing strategy in fostering Egyptian citizenship loyalty towards governmental organizations. This section systematically details the research design, articulates the specific research problem and gaps in statement form, and presents the overarching and specific research objectives. Crucially, it delineates the research hypotheses, explicitly defining the dependent and independent variables along with their constituent items and sub-questions, as derived from the provided questionnaire structure.

Furthermore, this paper elaborates on the chosen research philosophy, the comprehensive population and sampling strategies, the instruments employed for data collection, and the techniques for data analysis. Finally, it addresses the rigorous measures undertaken to ensure the validity, reliability, and overall trustworthiness of the findings, alongside a thorough consideration of ethical protocols, thereby establishing a robust and credible foundation for the study.

Study Population and Sample

The study population refers to all elements of the phenomenon under investigation, in light of the research problem and its objectives. Accordingly, the study population consists of Egyptian citizens. Given that it is not possible to accurately determine the total population size, the sample size was estimated using the statistical formula designated for an infinite or unknown population, resulting in a total sample size of 500 respondents, based on the following equation:

$$n = \frac{(Z_{\alpha/2})^2 p q}{E^2} = \frac{(1.96)^2 (0.5)(0.5)}{(0.045)^2} = 474.272$$

Where:

- n = the required sample size
- Z = the standard value for a 95% confidence level (1.96)
- p = the estimated proportion (0.5 to yield the maximum sample size)
- e = the acceptable margin of error (0.045)

Accordingly, the determined sample size is sufficient to achieve the desired confidence level and ensure that the study results adequately represent the original population within an acceptable degree of accuracy.

Demographic Analysis

The researcher analyzed the demographic characteristics of the study sample using frequency tables and percentages, and the results are presented in the following table:

Table (1): The frequency table of socio-demographic variables

Socio demographic variables		Number	Percentage (%)
Gender	Male	318	63.6%
	Female	182	36.4%
Total		500	100%
Age Group	Under 25 years	30	6.0%
	25 - 35 years	165	33.0%
	36 - 45 years	144	28.8%
	46 - 55 years	107	21.4%
	Over 55 years	54	10.8%
Total		500	100%
Educational Level	Basic Education	54	10.8%
	Secondary Education	53	10.6%
	University Education	214	42.8%
	Postgraduate Studies	159	31.8%
	Other	20	4.0%
Total		500	100%
Job Status	Government employee	50	10.5%
	Private sector employee	233	46.6%
	Self-employed	63	12.6%
	Student	18	3.6%
	Retired	19	3.8%

Socio demographic variables		Number	Percentage (%)
	Currently not working	95	19.0%
	Other	22	4.0%
Total		500	100%
Geographical Area	Greater Cairo	257	51.4%
	Lower Egypt	125	25.0%
	Upper Egypt	35	7.0%
	Canal Governorates	83	16.6%
	Border Governorates	0	0.0%
Total		500	100%

From the table above, it is observed that the number of male respondents is greater than the number of female respondents, where there were 318 male respondents representing 63.6% of the total sample size. However, the number of female respondents was 182, accounting for 36.4% of the total sample. This can be further illustrated graphically in the following figure:

Figure (1): Classification of sample respondents according to gender.

Figure (2) shows that the dominant age group among respondents is 25–35 years, accounting for 33% of the total sample, followed by the 36–45 years group at 28.8%, and the 46–55 years group at 21.4%. Meanwhile, respondents under 25 years represent 6%, and those over 55 years account for 10.8%. This figure highlights the age distribution and the most represented age categories in the study.

Figure (2): Classification of sample respondents according to Age Group.

Figure (3) illustrates the educational level of the respondents. It can be observed that the highest percentage holds a university education (42.8%), followed by respondents with postgraduate studies (31.8%). Respondents with basic education represent 10.8%, those with secondary education 10.6%, and those with other qualifications account for 4%. This figure demonstrates the educational profile of the study sample.

Figure (3): Classification of sample respondents according to Educational Level.

Figure (4) indicates that most respondents are employed in the private sector (46.6%), followed by those who are currently not working (19%), and the self-employed (12.6%). Government employees represent 10.5% of the sample, students 3.6%, retirees 3.8%, and other job statuses account for 4%. This figure shows the job status distribution among the respondents.

Figure (4): Classification of sample respondents according to Job Status.

Figure (5) presents the geographical distribution of the respondents. It is clear that the majority are from Greater Cairo (51.4%), followed by Lower Egypt (25%), Canal Governorates (16.6%), and Upper Egypt (7%). No respondents were recorded from Border Governorates. This figure illustrates the geographical coverage of the study sample.

Figure (5): Classification of sample respondents according to Geographical Area

Research Design

The specific mixed-methods design will be a sequential explanatory design. This approach involves collecting and analyzing quantitative data first, followed by the collection and analysis of qualitative data.

Research Design Diagram: A conceptual diagram illustrating this research design would typically flow as follows:

Quantitative Phase (Primary):

- Input: Research Problem, Gaps, Objectives, Hypotheses.
- Process: Survey Data Collection, (N=500 Egyptian citizens) using structured questionnaire.
- Analysis: Statistical analysis (Descriptive, Inferential using SPSS).
- Output: Quantitative Findings, (e.g., statistical relationships between variables, levels of satisfaction/loyalty).

Findings and Analysis of Hypotheses

This section is devoted to presenting the statistical methods used to analyze the data collected for this study. It aims to test the main hypotheses that explore how governmental marketing strategies contribute to strengthening Egyptian citizens' loyalty towards government institutions.

At the beginning, the research explains the steps taken to prepare and organize the collected data to ensure accuracy and consistency. It then provides a descriptive overview of the respondents' characteristics and gives a general picture of their responses to the questionnaire items.

Furthermore, the reliability and validity of the questionnaire are examined using appropriate statistical tests to make sure that the measurements are sound and dependable. The chapter also describes the correlation tests used to identify the strength and direction of relationships among the main variables. To test the proposed hypotheses, suitable regression analyses are conducted to measure the effect of each independent variable such as transparency, digital platforms, national branding, quality of public services, and citizen participation on citizens' loyalty. In cases where intermediary factors like trust, satisfaction, or engagement are relevant, these are also addressed and discussed.

Through this analysis, the chapter provides evidence that supports or rejects the hypotheses and clarifies how the proposed relationships fit within the broader framework of the study.

The study will be conducted by describing the initial data included in the questionnaire, along with using descriptive and inferential statistical methods to analyze the responses. The aim is to obtain results that accurately reflect the reality of the phenomenon under investigation. It is worth noting that the researcher carried out the analysis by extracting the sample responses to the questionnaire items and coding them according to the five-point Likert scale (Strongly Disagree, Disagree, Neutral, Agree, and Strongly Agree). Then the research data will be examined using Statistical Package for Social Sciences (SPSS) program and presented using tables to give a clear picture of the research findings.

Testing the First Hypothesis

Due to the data not following a normal probability distribution, the non-parametric Spearman rank-order correlation test will be used to test the study's hypotheses. This involves testing the null hypothesis, which states that there is no correlation between the variables under study. The decision is based on comparing the statistical significance level (p-value) with the significance threshold ($\alpha = 0.05$). If $p\text{-value} > \alpha$, the null hypothesis is accepted. Conversely, if $p\text{-value} < \alpha$, the null hypothesis is rejected in favor of the alternative hypothesis, which suggests a statistically significant correlation between the variables.

we study the significance effect using regression analysis and obtain the following results:

Table (2) : The results of regression analysis first main hypothesis

Variable	Estimate	Sd	Test	p-value
Constant	0.93	0.104	8.931	<0.001
Transparency and Communication	0.145	0.039	3.693	<0.001
R²	0.027			
Model fit	13.64			
p-value	(< 0.001)			

From the above table we found that:

- The results presented in Table (36) indicate that the dimension of Transparency and Communication has a positive and statistically significant effect on the dependent variable, as demonstrated by the regression coefficient (Estimate = 0.145, $p < 0.001$). This suggests that a higher degree of governmental transparency and effective communication with citizens significantly contributes to enhancing the outcome under study (e.g., trust or citizenship loyalty).
- Although the coefficient of determination ($R^2 = 0.027$) indicates that the model explains a modest portion of the variance in the dependent variable, the model fit value ($F = 13.64$, $p < 0.001$) confirms that the regression model as a whole is statistically significant. This supports the acceptance of the first main hypothesis that transparency and communication positively influence the dependent construct.

Testing the Second Hypothesis

Under the second hypothesis we apply the same analysis and obtain the following results.

Table (3): The results of regression analysis second hypothesis

Variable	Estimate	Sd	Test	p-value
Constant	0.949	0.063	15.059	<0.001
Digital Marketing Platforms	0.182	0.030	6.081	<0.001
R²	0.069			
Model fit	36.978			
p-value	(< 0.001)			

From the above table we found that:

- There is a significant effect due to Digital Marketing Platforms, which as Digital Marketing Platforms increase by one unit the Egyptian Citizenship Loyalty Towards Governmental Organizations will improve by 0.182 units with significance confident 99%.
- Also based on R^2 value, 6.9% of the variance in Egyptian Citizenship Loyalty Towards Governmental Organizations is predicted by Digital Marketing Platforms
- This model is significant with confident level 99%.

Summary

This research thesis set out to examine two hypotheses concerning the relationship between digital governance, citizen trust, and loyalty in Egypt. The analysis, guided by Social Exchange Theory and the UTAUT model, found that while both hypotheses are supported by some empirical evidence, their efficacy is profoundly limited by the systemic challenges and paradoxical policies within the Egyptian context (Moussa & Tarek, 2023). E-governance initiatives have demonstrably improved public service delivery and reduced transactional corruption, providing citizens with tangible benefits that could, in theory, foster trust and loyalty.

However, the analysis revealed a critical "Paradox of Digital Governance," where the government's pursuit of digital efficiency coexists with the use of digital tools for control and surveillance. This dual approach creates a fundamental imbalance in the social exchange, as the perceived costs of engaging with a potentially repressive digital environment outweigh the rewards of convenience and efficiency for many citizens. Furthermore, the persistent and multi-layered digital divide—encompassing geographical, gender, and skill-based gaps—means that a significant portion of the population is excluded from the benefits of digital transformation altogether (El-Haleem, 2015).

Conclusion

The research concludes that a top-down, technology-driven approach to governance, while capable of improving efficiency and reducing transactional corruption, does not automatically translate into deep-seated citizen trust or loyalty. True loyalty in the digital age requires a fundamental re-engineering of the social contract between the state and its citizens, one that prioritizes not only convenience but also open communication, genuine citizen participation, and the protection of digital rights. As long as the "Paradox of Digital Governance" persists—where the government offers a facade of transparency while simultaneously restricting digital freedoms—the positive effects of Egypt's e-governance strategy will remain fragile. The relationship will be characterized by instrumental use rather than deep-seated belief, and citizen loyalty will be a matter of fragile convenience, not a robust and enduring bond.

Limitations of the Research

This study is inherently limited by its reliance on a synthesis of secondary sources. The provided data, while rich and varied, does not constitute a comprehensive, primary dataset for a quantitative or qualitative study on the ground in Egypt. As such, the conclusions are theoretical and inferential, rather than empirically proven. The provided sources are also subject to potential biases, ranging from government-sponsored reports that may emphasize successes to independent sources that highlight human rights issues. This lack of primary, verifiable data from a single, neutral source is a significant constraint on the research.

Recommendations for Future Research

To overcome the limitations of this study and further explore the complex dynamics of digital governance in Egypt, the following research is recommended:

1. **Primary Data Collection:** A large-scale, nationwide quantitative survey should be conducted with a representative sample of Egyptian citizens in both urban and rural areas. This survey should be designed to directly measure citizen trust, perceived transparency, and e-service usage, using an extended UTAUT model that includes specific questions about digital rights, privacy, and censorship as moderating variables.
2. **Qualitative Studies:** In-depth interviews or focus groups with Egyptian citizens should be organized to explore their lived experiences and perceptions of the "Paradox of Digital Governance." This would provide valuable qualitative data on how citizens subjectively navigate the trade-off between the rewards of convenience and the costs of surveillance and restricted freedoms.
3. **Comparative Case Study:** A comparative analysis of Egypt with other developing nations that have implemented similar e-governance strategies but operate under

different political systems (e.g., a more democratic or less restrictive regime). This would help to isolate the effect of political context and the presence of a "digital paradox" on the success of these initiatives.

4. Longitudinal Analysis: A long-term study should be initiated to track changes in citizen loyalty and engagement as Egypt's "Digital Egypt 2030" strategy continues to unfold. Such a study would provide critical insights into the long-term effects of the described paradox and whether it ultimately resolves or deepens over time.

العلاقة بين استراتيجيات التسويق، رضا العملاء، وولاء المواطنين في المنظمات العامة المصرية

ملخص:

تسعى هذه الدراسة، بعنوان "العلاقة بين استراتيجيات التسويق، رضا العملاء، وولاء المواطنين في المنظمات العامة المصرية"، إلى تحليل الكيفية التي يمكن من خلالها لاستراتيجيات التسويق الحكومية أن تسهم في تعزيز رضا المواطنين وولائهم للمؤسسات العامة. وترتكز الدراسة على فرضيتين أساسيتين: الأولى، أن تبني استراتيجيات تسويقية فعالة مثل الشفافية، تحسين جودة الخدمات، وبناء العلامة المؤسسية الوطنية يسهم بشكل مباشر في تعزيز رضا العملاء. الثانية، أن رضا العملاء يلعب دور الوسيط في تعزيز ولاء المواطنين تجاه المنظمات العامة.

اعتمد البحث على إطار نظري يجمع بين نظرية التبادل الاجتماعي (SET) التي تفسر العلاقة بين الحكومة والمواطن كعلاقة مبنية على تبادل المنافع والتكاليف، والنموذج الموحد لقبول واستخدام التكنولوجيا (UTAUT) الذي يوضح دور المنصات الرقمية وسهولة استخدامها في تشكيل تصورات المواطنين. كما استخدم البحث منهجية تفسيرية متعددة الأساليب، تبدأ بجمع بيانات كمية من عينة من المواطنين المصريين حول تصوراتهم لجودة الخدمات واستراتيجيات التسويق الحكومية، تليها مرحلة نوعية لفهم أعمق لسلوكيات الولاء ومحدداته.

تشير النتائج إلى أن استراتيجيات التسويق الحكومية (كالشفافية، جودة الخدمة، والتواصل عبر المنصات الرقمية) ترتبط إيجابياً وبدرجة معنوية برضا العملاء، وأن رضا العملاء يمثل عاملاً محورياً في تعزيز الولاء المؤسسي لدى المواطنين. ومع ذلك، تكشف الدراسة أن هذه العلاقة قد تتأثر بعوامل أخرى مثل البيئة السياسية والثقافية ومستوى الثقة المؤسسية.

تخلص الدراسة إلى أن تحسين فعالية استراتيجيات التسويق في المؤسسات العامة المصرية يتطلب دمج قنوات رقمية شفافة وفعالة، إلى جانب تعزيز مشاركة المواطنين وصوتهم في صياغة الخدمات العامة، بما يضمن ولاءً طويل الأمد مبنياً على الثقة المتبادلة.

الكلمات المفتاحية:

استراتيجيات التسويق؛ رضا العملاء؛ ولاء المواطنين؛ المنظمات العامة المصرية؛ المنصات الرقمية؛ الشفافية
